gWidgetsRGtk2-package

Toolkit implementation of gWidgets for RGtk2

Description

Port of gWidgets API to RGtk2

Details

This package allows the gWidgets API to use the RGtk2 package allowing the use of the GTK libraries within R. The documentation for the functions in this package are contained in the gWidgets package.

As gWidgets is meant to be multi-toolkit, this file documents differences from the API, as defined by the man pages of the **gWidgets** package.

Containers:

To access the underlying gtk container from a `gframe` object one uses `getToolkitWidget(obj)$getParent()`

Widgets:

For the data frame viewer `gtable` when no filtering is requested, the default, the column headers can be clicked to sort the values.

In the data frame editor `gdf` the `subset` option only works if the column names have not been changed.

The `gaction` constructor produces action objects. The `enabled<-` method can be used to set their sensitivity. The objects can be used with `gbutton` through the `action` argument, and in the lists defining menubars and toolbars. The `key.accel` argument of the constructor is ignored for now. The `tooltip` is OS sensitive, as it depends on the event loop implementation.

The `gtoolbar` list can have components that are a) lists with a handler component, b) lists with a separator component, c) `gaction` instances d) `gWidgets`, in which case the widget appears in the toolbar. The latter is not portable to other `gWidgets` implementations.

Methods:

The `font` method is not implemented.

For widgets which allow markup (`gframe`, `glabel`) PANGO markup is used. This is not HTML, but is similar to basic HTML.

gWidgetsRGtk2 and the RGtk2 package:

The **RGtk2** package is imported only so its namespace, which is large, is not loaded by default. To access its functions, load the package.

The **RGtk2** package and **gWidgetsRGtk2** can be used together in the following ways. First, an **RGtk2** object can be added to a **gWidgetsRGtk2** through the `add` method of the container. This works for most objects. If you find one that doesn't work, simply place it inside a `gtkHBox` container, then add that container. Second, a **gWidgetsRGtk2** object can be added to a **RGtk2** container by adding the return value of the `getToolkitWidget` method of the object. Again, this should work, but if not, the **gWidgetsRGtk2** can be added to a `ggroup` container first. In either case, the **gWidgetsRGtk2** object should not be attached to a container, so in particular the constructor should be called with its `container` argument as `NULL` (the default).

`gWidgets`

`as.gWidgetsRGtk2` *Coerce an RGtk2 object into a gWidgetsRGtk2 object*

Description

This function coerces an `RGtk2` object into a `gWidgetsRGtk2` object, thereby allowing most of the methods to work on the new object.

Usage

```
as.gWidgetsRGtk2(widget, ...)
```

Arguments

<code>widget</code>	An object of class <code>RGtkObject</code>
<code>...</code>	Ignored here

Details

Many `RGtk2` widgets can be coerced into `gWidgetsRGtk2` objects. This allows the method of `gWidgets` to be called. The example shows how one can use `glade` to layout a dialog, and use `gWidget` methods for the handlers.

Value

Returns a `gWidgetsRGtk2` object. (This is not a `gWidgets` object, so there may be some oddities)

Examples

```
## Not run:
## This requires glade libraries to be installed before compiling RGtk2
options("guiToolkit"="RGtk2")
library(RGtk2)
library(gWidgets)
library(gWidgetsRGtk2)

gladeFile <- system.file("examples/t.test.glade", package="gWidgetsRGtk2")
GUI <- gladeXMLNew("t.test.glade")

w <- GUI$GetWidget("window1")
w$Show() # show
win <- as.gWidgetsRGtk2(w)

gladeXMLGetWidgetNames <- function(obj) {
  sapply(obj$GetWidgetPrefix(""), gladeGetWidgetName)
}

gladeXMLGetgWidgetsRGtk2 <- function(obj) {
  nms <- obj$GetWidgetNames()
  widgets <- sapply(nms, function(i) obj$GetWidget(i))
  widgets <- sapply(widgets, as.gWidgetsRGtk2)
  return(widgets)
}

l <- GUI$GetgWidgetsRGtk2()

## val names have similar form
valNames <- grep("Val$", GUI$GetWidgetNames())
defHandler <- function(...) {
  lst <- list()
  args <- c("x", "y", "mu", "alt", "var.equal", "paired", "conf.level")
  for(i in args) {
    key <- paste(i, "Val", sep="")
    widget <- l[[key]]
    val <- svalue(widget)
    if(!is.null(val) && val != "")
      lst[[i]] <- val
  }
  if(!is.null(lst$x)) {
    cmd <- "t.test("
    argList <- c()
    for(i in names(lst)) {
      argList <- c(argList, paste(i, "=", lst[[i]], sep=""))
    }
    cmd <- paste(cmd, paste(argList, collapse=", "), ", ", sep="")
  }
}
```

```
        print(cmd)
    }
}
## Add handler to each widget
sapply(valNames, function(i) addHandlerChanged(l[[i]], handler=defHandler))
## put handler on dismiss button
addHandlerChanged(l[['dismiss']], handler = function(h,...) dispose(win))
## End(Not run)
```

gWidgetsRGtk2-misc *Miscellaneous functions in gWidgetsRGtk*

Description

These functions are hardly worth documenting. They are used by pmg, but are not part of the gWidgets API, nor meant for general consumption.

gWidgetsRGtk2-undocumented

Undocumented functions in gWidgetsRGtk

Description

The gWidgetsRGtk package implements the gWidgets API. In gWidgets the primary constructors and methods are documented. The basic idea is that `function` in gWidgets calls `.function` in gWidgetsRGtk. Hence the many functions here.
