

Package ‘mixtools’

October 20, 2009

Version 0.4.3

Date October 2009

Title Tools for analyzing finite mixture models

Author Derek Young Tatiana Benaglia Didier Chauveau Ryan Elmore Tom Hettmansperger David Hunter Hoben Thomas Fengjuan Xuan

Maintainer Derek Young <dsy109@stat.psu.edu>

Depends boot, MASS, R (>= 2.0.0)

Description A collection of R functions for analyzing finite mixture models. This package is based upon work supported by the National Science Foundation under Grant No. SES-0518772.

License GPL (>= 2)

boot.comp

Performs Parametric Bootstrap for Sequentially Testing the Number of Components in Various Mixture Models

Description

Performs a parametric bootstrap by producing B bootstrap realizations of the likelihood ratio statistic for testing the null hypothesis of a k -component fit versus the alternative hypothesis of a $(k+1)$ -component fit to various mixture models. This is performed for up to a specified number of maximum components, k . A p-value is calculated for each test and once the p-value is above a specified significance level, the testing terminates. An optional histogram showing the distribution of the likelihood ratio statistic along with the observed statistic can also be produced.

Usage

```
boot.comp(y, x = NULL, N = NULL, max.comp = 2, B = 100,
          sig = 0.05, arbmean = TRUE, arbvar = TRUE,
          mix.type = c("logisregmix", "multmix", "mvnormalmix",
                      "normalmix", "poisregmix", "regmix", "regmix.mixed",
                      "repnormmix"), hist = TRUE, ...)
```

Arguments

<code>y</code>	The raw data for <code>multmix</code> , <code>mvnormalmix</code> , <code>normalmix</code> , and <code>repnormmix</code> and the response values for <code>logisregmix</code> , <code>poisregmix</code> , and <code>regmix</code> . See the documentation concerning their respective EM algorithms for specific structure of the raw data.
<code>x</code>	The predictor values required only for the regression mixtures <code>logisregmix</code> , <code>poisregmix</code> , and <code>regmix</code> . A column of 1s for the intercept term must not be included! See the documentation concerning their respective EM algorithms for specific structure of the predictor values.
<code>N</code>	An n-vector of number of trials for the logistic regression type <code>logisregmix</code> . If <code>NULL</code> , then <code>N</code> is an n-vector of 1s for binary logistic regression.
<code>max.comp</code>	The maximum number of components to test for. The default is 2. This function will perform a test of k -components versus $(k+1)$ -components sequentially until we fail to reject the null hypothesis. This decision rule is governed by the calculated p-value and <code>sig</code> .
<code>B</code>	The number of bootstrap realizations of the likelihood ratio statistic to produce. The default is 100, but ideally, values of 1000 or more would be more acceptable.
<code>sig</code>	The significance level for which to compare the p-value against when performing the test of k -components versus $(k+1)$ -components.
<code>arbmean</code>	If <code>FALSE</code> , then a scale mixture analysis can be performed for <code>mvnormalmix</code> , <code>normalmix</code> , <code>regmix</code> , or <code>repnormmix</code> . The default is <code>TRUE</code> .

arbvar	If FALSE, then a location mixture analysis can be performed for <code>mvnormalmix</code> , <code>normalmix</code> , <code>regmix</code> , or <code>repnormmix</code> . The default is TRUE.
mix.type	The type of mixture analysis you wish to perform. The data inputted for <code>y</code> and <code>x</code> depend on which type of mixture is selected. <code>logisregmix</code> corresponds to a mixture of logistic regressions. <code>multmix</code> corresponds to a mixture of multinomials with data determined by the cut-point method. <code>mvnormalmix</code> corresponds to a mixture of multivariate normals. <code>normalmix</code> corresponds to a mixture of univariate normals. <code>poisregmix</code> corresponds to a mixture of Poisson regressions. <code>regmix</code> corresponds to a mixture of regressions with normal components. <code>regmix.mixed</code> corresponds to a mixture of regressions with random or mixed effects. <code>repnormmix</code> corresponds to a mixture of normals with repeated measurements.
hist	An argument to provide a matrix plot of histograms for the bootstrapped likelihood ratio statistic.
...	Additional arguments passed to the various EM algorithms for the mixture of interest.

Value

`boot.comp` returns a list with items:

<code>p.values</code>	The p-values for each test of k-components versus (k+1)-components.
<code>log.lik</code>	The B bootstrap realizations of the likelihood ratio statistic.
<code>obs.log.lik</code>	The observed likelihood ratio statistic for each test which is used in determining the p-values.

## Bootstrapping to test the number of components on the RTdata.

data(RTdata)
x<-as.matrix(RTdata[, 1:3])
y<-makemultdata(x, cuts = quantile(x, (1:9)/10))$y
a<-boot.comp(y = y, max.comp = 1, B = 5, mix.type = "multmix",
             epsilon = 1e-3)
a$p.values
```

 boot.se

Performs Parametric Bootstrap for Standard Error Approximation

Description

Performs a parametric bootstrap by producing B bootstrap samples for the parameters in the specified mixture model.

Usage

```
boot.se(em.fit, B = 100, arbmean = TRUE, arbvar = TRUE,
        N = NULL, ...)
```

Arguments

em.fit	An object of class <code>mixEM</code> . The estimates produced in <code>em.fit</code> will be used as the parameters for the distribution from which we generate the bootstrap data.
B	The number of bootstrap samples to produce. The default is 100, but ideally, values of 1000 or more would be more acceptable.
arbmean	If FALSE, then a scale mixture analysis can be performed for <code>mvnormalmix</code> , <code>normalmix</code> , <code>regmix</code> , or <code>repnormmix</code> . The default is TRUE.
arbvar	If FALSE, then a location mixture analysis can be performed for <code>mvnormalmix</code> , <code>normalmix</code> , <code>regmix</code> , or <code>repnormmix</code> . The default is TRUE.
N	An n-vector of number of trials for the logistic regression type <code>logisregmix</code> . If NULL, then N is an n-vector of 1s for binary logistic regression.
...	Additional arguments passed to the various EM algorithms for the mixture of interest.

Value

`boot.se` returns a list with the bootstrap samples and standard errors for the mixture of interest.

References

McLachlan, G. J. and Peel, D. (2000) *Finite Mixture Models*, John Wiley & Sons, Inc.

Examples

```
## Bootstrapping standard errors for a regression mixture case.

data(NOdata)
attach(NOdata)
em.out<-regmixEM(Equivalence, NO, arbvar = FALSE)
out.bs<-boot.se(em.out, B = 15, arbvar = FALSE)
out.bs
```

 CO2data

GNP and CO2 Data Set

Description

This data set gives the gross national product (GNP) per capita in 1996 for various countries as well as their estimated carbon dioxide (CO2) emission per capita for the same year.

Usage

CO2data

Format

This data frame consists of 28 countries and the following columns:

GNP The gross national product per capita in 1996.

CO2 The estimated carbon dioxide emission per capita in 1996.

country An abbreviation pertaining to the country measured (e.g., "GRC" = Greece and "CH" = China).

References

Hurn, M., Justel, A. and Robert, C. P. (2003) Estimating Mixtures of Regressions, *Journal of Computational and Graphical Statistics* **12(1)**, 55–79.

 compCDF

Plot the Component CDF

Description

Plot the components' CDF via the posterior probabilities.

Usage

```
compCDF(data, weights,
        x=seq(min(data, na.rm=TRUE), max(data, na.rm=TRUE), len=250),
        comp=1:NCOL(weights), makeplot=TRUE, ...)
```

Arguments

<code>data</code>	A matrix containing the raw data. Rows are subjects and columns are repeated measurements.
<code>weights</code>	The weights to compute the empirical CDF; however, most of time they are the posterior probabilities.
<code>x</code>	The points at which the CDFs are to be evaluated.
<code>comp</code>	The mixture components for which CDFs are desired.
<code>makeplot</code>	Logical: Should a plot be produced as a side effect?
<code>...</code>	Additional arguments (other than <code>lty</code> and <code>type</code> , which are already used) to be passed directly to <code>plot</code> and <code>lines</code> functions.

Details

When `makeplot` is TRUE, a line plot is produced of the CDFs evaluated at `x`. The plot is not a step function plot; the points $(x, CDF(x))$ are simply joined by line segments.

Value

A matrix with `length(comp)` rows and `length(x)` columns in which each row gives the CDF evaluated at each point of `x`.

Examples

```
## The sulfur content of the coal seams in Texas

A<-c(1.51, 1.92, 1.08, 2.04, 2.14, 1.76, 1.17)
B<-c(1.69, 0.64, .9, 1.41, 1.01, .84, 1.28, 1.59)
C<-c(1.56, 1.22, 1.32, 1.39, 1.33, 1.54, 1.04, 2.25, 1.49)
D<-c(1.3, .75, 1.26, .69, .62, .9, 1.2, .32)
E<-c(.73, .8, .9, 1.24, .82, .72, .57, 1.18, .54, 1.3)

dis.coal<-makemultdata(A, B, C, D, E,
                      cuts = median(c(A, B, C, D, E)))
temp<-multmixEM(dis.coal)

## Now plot the components' CDF via the posterior probabilities

compCDF(dis.coal$x, temp$posterior, xlab="Sulfur", ylab="", main="empirical CDFs")
```

density.npEM *Normal kernel density estimate for nonparametric EM output*

Description

Takes an object of class `npEM` and returns an object of class `density` giving the kernel density estimate for the selected component and, if applicable, the selected block.

Usage

```
## S3 method for class 'npEM':
density(x, u=NULL, component=1, block=1, scale=FALSE, ...)
```

Arguments

<code>x</code>	An object of class <code>npEM</code> such as the output of the <code>npEM</code> or <code>spEMsymloc</code> functions.
<code>u</code>	Vector of points at which the density is to be evaluated
<code>component</code>	Mixture component number; should be an integer from 1 to the number of columns of <code>x\$posteriors</code> .
<code>block</code>	Block of repeated measures. Only applicable in repeated measures case, for which <code>x\$blockid</code> exists; should be an integer from 1 to <code>max(x\$blockid)</code> .
<code>scale</code>	Logical: If TRUE, multiply the density values by the corresponding mixing proportions found in <code>x\$lambdahat</code>
<code>...</code>	Additional arguments; not used by this method.

Details

The bandwidth is taken to be the same as that used to produce the `npEM` object, which is given by `x$bandwidth`.

Value

`density.npEM` returns a list of type "density". See `density` for details. In particular, the output of `density.npEM` may be used directly by functions such as `plot` or `lines`.

See Also

`npEM`, `spEMsymloc`, `plot.npEM`

Examples

```
## Look at histogram of Old Faithful waiting times
data(faithful)
Minutes <- faithful$waiting
hist(Minutes, freq=FALSE)

## Superimpose equal-variance normal mixture fit:
nm <- normalmixEM(Minutes, mu=c(50,80), sigma=5, arbvar=FALSE, fast=TRUE)
x <- seq(min(Minutes), max(Minutes), len=200)
for (j in 1:2)
  lines(x, nm$lambda[j]*dnorm(x, mean=nm$mu[j], sd=nm$sigma), lwd=3, lty=2)

## Superimpose several semiparametric fits with different bandwidths:
bw <- c(1, 3, 5)
for (i in 1:3) {
  sp <- spEMsymloc(Minutes, c(50,80), bw=bw[i])
  for (j in 1:2)
    lines(density(sp, component=j, scale=TRUE), col=1+i, lwd=2)
}
legend("topleft", legend=paste("Bandwidth =",bw), fill=2:4)
```

density.spEM

*Normal kernel density estimate for semiparametric EM output***Description**

Takes an object of class `spEM` and returns an object of class `density` giving the kernel density estimate.

Usage

```
## S3 method for class 'spEM':
density(x, u=NULL, component=1, block=1, scale=FALSE, ...)
```

Arguments

<code>x</code>	An object of class <code>npEM</code> such as the output of the <code>npEM</code> or <code>spEMsymloc</code> functions.
<code>u</code>	Vector of points at which the density is to be evaluated
<code>component</code>	Mixture component number; should be an integer from 1 to the number of columns of <code>x\$posteriors</code> .
<code>block</code>	Block of repeated measures. Only applicable in repeated measures case, for which <code>x\$blockid</code> exists; should be an integer from 1 to <code>max(x\$blockid)</code> .
<code>scale</code>	Logical: If <code>TRUE</code> , multiply the density values by the corresponding mixing proportions found in <code>x\$lambdahat</code>
<code>...</code>	Additional arguments; not used by this method.

Details

The bandwidth is taken to be the same as that used to produce the `npEM` object, which is given by `x$bandwidth`.

Value

`density.spEM` returns a list of type "density". See [density](#) for details. In particular, the output of `density.spEM` may be used directly by functions such as [plot](#) or [lines](#).

See Also

[spEM](#), [spEMsymloc](#), [plot.spEM](#)

Examples

```
mu <- matrix(c(0, 15), 2, 3)
sigma <- matrix(c(1, 5), 2, 3)
x <- rmvnormmix(300, lambda = c(.4, .6), mu = mu, sigma = sigma)

d <- spEM(x, mu0 = 2, blockid = rep(1,3), constbw = TRUE)
plot(d, xlim=c(-10, 40), ylim = c(0, .16), xlab = "", breaks = 30,
      cex.lab=1.5, cex.axis=1.5) # plot.spEM calls density.spEM here
```

depth

Elliptical and Spherical Depth

Description

Computation of spherical or elliptical depth.

Usage

```
depth(pts, x, Cx = var(x))
```

Arguments

<code>pts</code>	A $k \times d$ matrix containing the k points that one wants to compute the depth. Each row is a point.
<code>x</code>	A $n \times d$ matrix containing the reference data. Each row is an observation.
<code>Cx</code>	A $d \times d$ scatter matrix for the data x where the default is <code>var(x)</code> . When <code>Cx = I(d)</code> , it returns the spherical depth.

Value

`depth` returns a k -vector where each entry is the elliptical depth of a point in `pts`.

Note

depth is used in regcr.

References

Elmore, R. T., Hettmansperger, T. P. and Xuan, F. (2000) Spherical Data Depth and a Multivariate Median, *Proceedings of Data Depth: Robust Multivariate Statistical Analysis, Computational Geometry and Applications*.

See Also

[regcr](#)

Examples

```
x<-matrix(rnorm(200),nc = 2)
depth(x[1:3, ], x)
```

dmvnorm

The Multivariate Normal Density

Description

Density and log-density for the multivariate normal distribution with mean equal to `mu` and variance matrix equal to `sigma`.

Usage

```
dmvnorm(y, mu=NULL, sigma=NULL)
logdmvnorm(y, mu=NULL, sigma=NULL)
```

Arguments

<code>y</code>	Either a d -vector or an $n \times d$ matrix, where d is the dimension of the normal distribution and n is the number of points at which the density is to be evaluated.
<code>mu</code>	d -vector: Mean of the normal distribution (or NULL uses the origin as default)
<code>sigma</code>	$d \times d$ matrix: Variance matrix of the normal distribution (or NULL uses the identity matrix as default)

Details

This code is written to be efficient, using the qr-decomposition of the covariance matrix (and using it only once, rather than recalculating it for both the determinant and the inverse of `sigma`).

Value

`dmvnorm` gives the densities, `logdmvnorm` gives the logarithm of the densities

See Also

[qr](#), [qr.solve](#), [dnorm](#), [rmvnorm](#)

 ellipse

Draw Two-Dimensional Ellipse Based on Mean and Covariance

Description

Draw a two-dimensional ellipse that traces a bivariate normal density contour for a given mean vector, covariance matrix, and probability content.

Usage

```
ellipse(mu, sigma, alpha = .05, npoints = 250, newplot = FALSE,
        draw = TRUE, ...)
```

Arguments

<code>mu</code>	A 2-vector giving the mean.
<code>sigma</code>	A 2x2 matrix giving the covariance matrix.
<code>alpha</code>	Probability to be excluded from the ellipse. The default value is <code>alpha = .05</code> , which results in a 95% ellipse.
<code>npoints</code>	Number of points comprising the border of the ellipse.
<code>newplot</code>	If <code>newplot = TRUE</code> and <code>draw = TRUE</code> , plot the ellipse on a new plot. If <code>newplot = FALSE</code> and <code>draw = TRUE</code> , add the ellipse to an existing plot.
<code>draw</code>	If <code>TRUE</code> , draw the ellipse.
<code>...</code>	Graphical parameters passed to <code>lines</code> or <code>plot</code> command.

Value

`ellipse` returns an `npointsx2` matrix of the points forming the border of the ellipse.

```
## Produce a 95% ellipse with the specified mean and covariance structure.

mu<-c(1, 3)
sigma<-matrix(c(1, .3, .3, 1.5), 2, 2)

ellipse(mu, sigma, npoints = 200, newplot = TRUE)
```

flaremixEM

EM Algorithm for Mixtures of Regressions with Flare

Description

Returns output for 2-component mixture of regressions with flaring using an EM algorithm with one step of Newton-Raphson requiring an adaptive barrier for maximization of the objective function. A mixture of regressions with flare occurs when there appears to be a common regression relationship for the data, but the error terms have a mixture structure of one normal component and one exponential component.

Usage

```
flaremixEM(y, x, lambda = NULL, beta = NULL, sigma = NULL,
           alpha = NULL, nu = NULL, epsilon = 1e-04,
           maxit = 10000, verb = FALSE, restart = 50)
```

Arguments

y	An n-vector of response values.
x	An n-vector of predictor values. An intercept term will be added by default.
lambda	Initial value of mixing proportions. Entries should sum to 1.
beta	Initial value of beta parameters. Should be a 2x2 matrix where the columns correspond to the component.
sigma	A vector of standard deviations.
alpha	A scalar for the exponential component's rate.
nu	A vector specifying the barrier constants to use. The first barrier constant where the algorithm converges is used.
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.
restart	The number of times to restart the algorithm in case convergence is not attained. The default is 50.

Value

flaremixEM returns a list of class mixEM with items:

x	The set of predictors (which includes a column of 1's).
y	The response values.
posterior	An nx2 matrix of posterior probabilities for observations.
lambda	The final mixing proportions.
beta	The final regression coefficients.
sigma	The final standard deviations.
alpha	The final exponential rate.
loglik	The final log-likelihood.
all.loglik	A vector of each iteration's log-likelihood.
ft	A character vector giving the name of the function.

See Also

[regmixEM](#)

Examples

```
## Simulation output.

j=1
while(j == 1){
  x1=runif(30, 0, 10)
  x2=runif(20, 10, 20)
  x3=runif(30, 20, 30)
  y1=3+4*x1+rnorm(30, sd = 1)
  y2=3+4*x2+rexp(20, rate = .05)
  y3=3+4*x3+rnorm(30, sd = 1)
  x=c(x1, x2, x3)
  y=c(y1, y2, y3)
  nu=(1:30)/2

  out=try(flaremixEM(y, x, beta = c(3, 4), nu = nu,
                    lambda = c(.75, .25), sigma = 1), silent = TRUE)
  if(class(out) == "try-error"){
    j=1
  } else j=2
}

out[4:7]
plot(x, y)
abline(out$beta)
```

gammamixEM

*EM Algorithm for Mixtures of Gamma Distributions***Description**

Return EM algorithm output for mixtures of gamma distributions.

Usage

```
gammamixEM(x, lambda = NULL, alpha = NULL, beta = NULL, k = 2,
           epsilon = 1e-08, maxit = 1000, maxrestarts=20,
           verb = FALSE)
```

Arguments

<code>x</code>	A vector of length <code>n</code> consisting of the data.
<code>lambda</code>	Initial value of mixing proportions. If <code>NULL</code> , then <code>lambda</code> is random from a uniform Dirichlet distribution (i.e., its entries are uniform random and then it is normalized to sum to 1).
<code>alpha</code>	Starting value of vector of component shape parameters. If non- <code>NULL</code> and a vector, <code>k</code> is set to <code>length(alpha)</code> . If <code>NULL</code> , then the initial value is estimated by partitioning the data into <code>k</code> regions (with <code>lambda</code> determining the proportion of values in each region) and then calculating the method of moments estimates.
<code>beta</code>	Starting value of vector of component scale parameters. If non- <code>NULL</code> and a vector, <code>k</code> is set to <code>length(beta)</code> . If <code>NULL</code> , then the initial value is estimated the same method described for <code>alpha</code> .
<code>k</code>	Number of components. Initial value ignored unless <code>alpha</code> and <code>beta</code> are both <code>NULL</code> .
<code>epsilon</code>	The convergence criterion. Convergence is declared when the change in the observed data log-likelihood increases by less than <code>epsilon</code> .
<code>maxit</code>	The maximum number of iterations.
<code>maxrestarts</code>	The maximum number of restarts allowed in case of a problem with the particular starting values chosen (each restart uses randomly chosen starting values).
<code>verb</code>	If <code>TRUE</code> , then various updates are printed during each iteration of the algorithm.

Value

`gammamixEM` returns a list of class `mixEM` with items:

<code>x</code>	The raw data.
<code>lambda</code>	The final mixing proportions.
<code>gamma.pars</code>	A $2 \times k$ matrix where each column provides the component estimates of <code>alpha</code> and <code>beta</code> .

loglik	The final log-likelihood.
posterior	An $n \times k$ matrix of posterior probabilities for observations.
all.loglik	A vector of each iteration's log-likelihood. This vector includes both the initial and the final values; thus, the number of iterations is one less than its length.
ft	A character vector giving the name of the function.

Examples

```
##Analyzing a 3-component mixture of gammas.

x<-c(rgamma(200, shape = 0.2, scale = 14), rgamma(200,
  shape = 32, scale = 10), rgamma(200, shape = 5, scale = 6))
out<-gammamixEM(x, lambda = c(1, 1, 1)/3, verb = TRUE)
out[2:4]
```

hmeEM

EM Algorithm for Mixtures-of-Experts

Description

Returns EM algorithm output for a mixture-of-experts model. Currently, this code only handles a 2-component mixture-of-experts, but will be extended to the general k -component hierarchical mixture-of-experts.

Usage

```
hmeEM(y, x, lambda = NULL, beta = NULL, sigma = NULL, w = NULL,
  k = 2, addintercept = TRUE, epsilon = 1e-08,
  maxit = 10000, verb = FALSE)
```

Arguments

y	An n -vector of response values.
x	An $n \times p$ matrix of predictors. See <code>addintercept</code> below.
lambda	Initial value of mixing proportions, which are modeled as an inverse logit function of the predictors. Entries should sum to 1. If NULL, then <code>lambda</code> is taken as $1/k$ for each x .
beta	Initial value of <code>beta</code> parameters. Should be a $p \times k$ matrix, where p is the number of columns of <code>x</code> and k is number of components. If NULL, then <code>beta</code> has standard normal entries according to a binning method done on the data.

sigma	A vector of standard deviations. If NULL, then $1/\text{sigma}^2$ has random standard exponential entries according to a binning method done on the data.
w	A p-vector of coefficients for the way the mixing proportions are modeled. See lambda.
k	Number of components. Currently, only $k=2$ is accepted.
addintercept	If TRUE, a column of ones is appended to the x matrix before the value of p is calculated.
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

hmeEM returns a list of class `mixEM` with items:

x	The set of predictors (which includes a column of 1's if <code>addintercept = TRUE</code>).
y	The response values.
w	The final coefficients for the functional form of the mixing proportions.
lambda	An $n \times k$ matrix of the final mixing proportions.
beta	The final regression coefficients.
sigma	The final standard deviations. If <code>arbmean = FALSE</code> , then only the smallest standard deviation is returned. See <code>scale</code> below.
loglik	The final log-likelihood.
posterior	An $n \times k$ matrix of posterior probabilities for observations.
all.loglik	A vector of each iteration's log-likelihood.
restarts	The number of times the algorithm restarted due to unacceptable choice of initial values.
ft	A character vector giving the name of the function.

Integrated Squared Error for a selected density from npEM output

Description

Computes the integrated squared error for a selected estimated density from `npEM` output (selected by specifying the component and block number), relative to a true pdf that must be specified by the user. The range for the numerical integration must be specified. This function also returns (by default) a plot of the true and estimated densities.

Usage

```
ise.npEM(npEMout, component=1, block=1, truepdf, lower=-Inf,
         upper=Inf, plots = TRUE, ...)
```

Arguments

<code>npEMout</code>	An object of class <code>npEM</code> such as the output of the <code>npEM</code> function
<code>component, block</code>	Component and block of particular density to analyze from <code>npEMout</code> .
<code>truepdf</code>	an R function taking a numeric first argument and returning a numeric vector of the same length. Returning a non-finite element will generate an error.
<code>lower, upper</code>	the limits of integration. Can be infinite.
<code>plots</code>	logical: Should plots be produced?
<code>...</code>	additional arguments to be passed to <code>truepdf</code> (and that may be mandatory like, e.g., the <code>df =</code> argument of <code>dt</code>). Remember to use argument names not matching those of <code>ise.npRM</code> .

Details

This function calls the `wkde` (weighted kernel density estimate) function.

Value

Just as for the `integrate` function, a list of class "integrate" with components

<code>value</code>	the final estimate of the integral.
<code>abs.error</code>	estimate of the modulus of the absolute error.
<code>subdivisions</code>	the number of subintervals produced in the subdivision process.
<code>message</code>	"OK" or a character string giving the error message.
<code>call</code>	the matched call.

logisregmixEM

EM Algorithm for Mixtures of Logistic Regressions

Description

Returns EM algorithm output for mixtures of logistic regressions with arbitrarily many components.

Usage

```

logisregmixEM(y, x, N = NULL, lambda = NULL, beta = NULL, k = 2,
  addintercept = TRUE, epsilon = 1e-08,
  maxit = 10000, verb = FALSE)

```

Arguments

y	An n-vector of successes out of N trials.
x	An n x p matrix of predictors. See <code>addintercept</code> below.
N	An n-vector of number of trials for the logistic regression. If <code>NULL</code> , then <code>N</code> is an n-vector of 1s for binary logistic regression.
lambda	Initial value of mixing proportions. Entries should sum to 1. This determines number of components. If <code>NULL</code> , then <code>lambda</code> is random from uniform Dirichlet and number of components is determined by <code>beta</code> .
beta	Initial value of <code>beta</code> parameters. Should be a p x k matrix, where p is the number of columns of x and k is number of components. If <code>NULL</code> , then <code>beta</code> is generated by binning the data into k bins and using <code>glm</code> on the values in each of the bins. If both <code>lambda</code> and <code>beta</code> are <code>NULL</code> , then number of components is determined by k.

k	Number of components. Ignored unless <code>lambda</code> and <code>beta</code> are both NULL.
<code>addintercept</code>	If TRUE, a column of ones is appended to the x matrix before the value of p is calculated.
<code>epsilon</code>	The convergence criterion.
<code>maxit</code>	The maximum number of iterations.
<code>verb</code>	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

`logisregmixEM` returns a list of class `mixEM` with items:

<code>x</code>	The predictor values.
<code>y</code>	The response values.
<code>lambda</code>	The final mixing proportions.
<code>beta</code>	The final logistic regression coefficients.
<code>loglik</code>	The final log-likelihood.
<code>posterior</code>	An <code>nxk</code> matrix of posterior probabilities for observations.
<code>all.loglik</code>	A vector of each iteration's log-likelihood.
<code>restarts</code>	The number of times the algorithm restarted due to unacceptable choice of initial values.
<code>ft</code>	A character vector giving the name of the function.

makemultdata

Produce Cutpoint Multinomial Data

Description

Change data into a matrix of multinomial counts using the cutpoint method and generate EM algorithm starting values for a k-component mixture of multinomials.

Usage

```
makemultdata(..., cuts)
```

Arguments

`...` Either vectors (possibly of different lengths) of raw data or an $n \times m$ matrix (or data frame) of data. If `...` are vectors of varying length, then `makemultdata` will create a matrix of size $n \times m$ where n is the sample size and m is the length of the vector with maximum length. Those vectors with length less than m will have NAs to make the corresponding row in the matrix of length m . If `...` is a matrix (or data frame), then the rows must correspond to the sample and the columns the repeated measures.

`cuts` A vector of cutpoints. This vector is sorted by the algorithm.

Details

The (i, j) th entry of the matrix y (for $j < p$) is equal to the number of entries in the i th column of x that are less than or equal to `cuts[j]`. The (i, p) th entry is equal to the number of entries greater than `cuts[j]`.

Value

`makemultdata` returns an object which is a list with components:

`x` An $n \times m$ matrix of the raw data.

`y` An $n \times p$ matrix of the discretized data where p is one more than the number of cutpoints. Each row is a multinomial vector of counts. In particular, each row should sum to the number of repeated measures for that sample.

multmixEM

EM Algorithm for Mixtures of Multinomials

Description

Return EM algorithm output for mixtures of multinomial distributions.

Usage

```
multmixEM(y, lambda = NULL, theta = NULL, k = 2,
          maxit = 10000, epsilon = 1e-08, verb = FALSE)
```

Arguments

<code>y</code>	Either An <code>n</code> x <code>p</code> matrix of data (multinomial counts), where <code>n</code> is the sample size and <code>p</code> is the number of multinomial bins, or the output of the <code>makemultdata</code> function. It is not necessary that all of the rows contain the same number of multinomial trials (i.e., the rowsums of <code>y</code> need not be identical).
<code>lambda</code>	Initial value of mixing proportions. Entries should sum to 1. This determines number of components. If <code>NULL</code> , then <code>lambda</code> is random from uniform Dirichlet and number of components is determined by <code>theta</code> .
<code>theta</code>	Initial value of <code>theta</code> parameters. Should be a <code>k</code> x <code>p</code> matrix, where <code>p</code> is the number of columns of <code>y</code> and <code>k</code> is number of components. Each row of <code>theta</code> should sum to 1. If <code>NULL</code> , then each row is random from uniform Dirichlet. If both <code>lambda</code> and <code>theta</code> are <code>NULL</code> , then number of components is determined by <code>k</code> .
<code>k</code>	Number of components. Ignored unless <code>lambda</code> and <code>theta</code> are <code>NULL</code> .
<code>epsilon</code>	The convergence criterion.
<code>maxit</code>	The maximum number of iterations.
<code>verb</code>	If <code>TRUE</code> , then various updates are printed during each iteration of the algorithm.

Value

`multmixEM` returns a list of class `mixEM` with items:

<code>y</code>	The raw data.
<code>lambda</code>	The final mixing proportions.
<code>theta</code>	The final multinomial parameters.
<code>loglik</code>	The final log-likelihood.
<code>posterior</code>	An <code>n</code> x <code>k</code> matrix of posterior probabilities for observations.
<code>all.loglik</code>	A vector of each iteration's log-likelihood.
<code>restarts</code>	The number of times the algorithm restarted due to unacceptable choice of initial values.
<code>ft</code>	A character vector giving the name of the function.

multmixmodel.sel *Model Selection Mixtures of Multinomials*

Description

Assess the number of components in a mixture of multinomials model using the Akaike's information criterion (AIC), Schwartz's Bayesian information criterion (BIC), Bozdogan's consistent AIC (CAIC), and Integrated Completed Likelihood (ICL).

Usage

```
multmixmodel.sel(y, comps = NULL, ...)
```

Arguments

<code>y</code>	Either An $n \times p$ matrix of data (multinomial counts), where n is the sample size and p is the number of multinomial bins, or the output of the <code>makemultdata</code> function. It is not necessary that all of the rows contain the same number of multinomial trials (i.e., the rowsums of <code>y</code> need not be identical).
<code>comps</code>	Vector containing the numbers of components to consider. If <code>NULL</code> , this is set to be $1:(\text{max possible})$, where (max possible) is $\text{floor}((m+1)/2)$ and m is the minimum row sum of <code>y</code> .
<code>...</code>	Additional arguments passed to <code>multmixEM</code> .

Value

`multmixmodel.sel` returns a table summarizing the AIC, BIC, CAIC, ICL, and log-likelihood values along with the winner (the number with the lowest aforementioned values).

```

mvnormalmixEM

*EM Algorithm for Mixtures of Multivariate Normals***Description**

Return EM algorithm output for mixtures of multivariate normal distributions.

Usage

```
mvnormalmixEM(x, lambda = NULL, mu = NULL, sigma = NULL, k = 2,
  arbmean = TRUE, arbvar = TRUE, epsilon = 1e-08,
  maxit = 10000, verb = FALSE)
```

Arguments

x	A matrix of size $n \times p$ consisting of the data.
lambda	Initial value of mixing proportions. Entries should sum to 1. This determines number of components. If NULL, then lambda is random from uniform Dirichlet and number of components is determined by mu.
mu	A list of size k consisting of initial values for the p-vector mean parameters. If NULL, then the vectors are generated from a normal distribution with mean and standard deviation according to a binning method done on the data. If both lambda and mu are NULL, then number of components is determined by sigma.
sigma	A list of size k consisting of initial values for the $p \times p$ variance-covariance matrices. If NULL, then sigma is generated using the data. If lambda, mu, and sigma are NULL, then number of components is determined by k.
k	Number of components. Ignored unless lambda, mu, and sigma are all NULL.
arbmean	If TRUE, then the component densities are allowed to have different mus. If FALSE, then a scale mixture will be fit.
arbvar	If TRUE, then the component densities are allowed to have different sigmas. If FALSE, then a location mixture will be fit.
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

normalmixEM returns a list of class mixEM with items:

x	The raw data.
lambda	The final mixing proportions.
mu	A list of with the final mean vectors.
sigma	A list with the final variance-covariance matrices.
loglik	The final log-likelihood.
posterior	An nxk matrix of posterior probabilities for observations.
all.loglik	A vector of each iteration's log-likelihood.
restarts	The number of times the algorithm restarted due to unacceptable choice of initial values.
ft	A character vector giving the name of the function.

 NOdata

Ethanol Fuel Data Set

Description

This data set gives the equivalence ratios and peak nitrogen oxide emissions in a study using pure ethanol as a spark-ignition engine fuel.

Usage

NOdata

Format

This data frame consists of:

NO The peak nitrogen oxide emission levels.

Equivalence The equivalence ratios for the engine at compression ratios from 7.5 to 18.

 normalmixEM

EM Algorithm for Mixtures of Univariate Normals

Description

Return EM algorithm output for mixtures of normal distributions.

Usage

```
normalmixEM (x, lambda = NULL, mu = NULL, sigma = NULL, k = 2,
             mean.constr = NULL, sd.constr = NULL,
             epsilon = 1e-08, maxit = 1000, maxrestarts=20,
             verb = FALSE, fast=FALSE, ECM = FALSE,
             arbmean = TRUE, arbvar = TRUE)
```

Arguments

<code>x</code>	A vector of length <code>n</code> consisting of the data.
<code>lambda</code>	Initial value of mixing proportions. Automatically repeated as necessary to produce a vector of length <code>k</code> , then normalized to sum to 1. If <code>NULL</code> , then <code>lambda</code> is random from a uniform Dirichlet distribution (i.e., its entries are uniform random and then it is normalized to sum to 1).
<code>mu</code>	Starting value of vector of component means. If non- <code>NULL</code> and a scalar, <code>arbmean</code> is set to <code>FALSE</code> . If non- <code>NULL</code> and a vector, <code>k</code> is set to <code>length(mu)</code> . If <code>NULL</code> , then the initial value is randomly generated from a normal distribution with center(s) determined by binning the data.
<code>sigma</code>	Starting value of vector of component standard deviations for algorithm. If non- <code>NULL</code> and a scalar, <code>arbvar</code> is set to <code>FALSE</code> . If non- <code>NULL</code> and a vector, <code>arbvar</code> is set to <code>TRUE</code> and <code>k</code> is set to <code>length(sigma)</code> . If <code>NULL</code> , then the initial value is the reciprocal of the square root of a vector of random exponential-distribution values whose means are determined according to a binning method done on the data.
<code>k</code>	Number of components. Initial value ignored unless <code>mu</code> and <code>sigma</code> are both <code>NULL</code> .
<code>mean.constr</code>	Equality constraints on the mean parameters, given as a vector of length <code>k</code> . Each vector entry helps specify the constraints, if any, on the corresponding mean parameter: If <code>NA</code> , the corresponding parameter is unconstrained. If numeric, the corresponding parameter is fixed at that value. If a character string consisting of a single character preceded by a coefficient, such as <code>"0.5a"</code> or <code>"-b"</code> , all parameters using the same single character in their constraints will fix these parameters equal to the coefficient times some the same free parameter. For instance, if <code>mean.constr = c(NA, 0, "a", "-a")</code> , then the first mean parameter is unconstrained, the second is fixed at zero, and the third and fourth are constrained to be equal and opposite in sign.
<code>sd.constr</code>	Equality constraints on the standard deviation parameters. See <code>mean.constr</code> .
<code>epsilon</code>	The convergence criterion. Convergence is declared when the change in the observed data log-likelihood increases by less than <code>epsilon</code> .
<code>maxit</code>	The maximum number of iterations.
<code>maxrestarts</code>	The maximum number of restarts allowed in case of a problem with the particular starting values chosen due to one of the variance estimates getting too small (each restart uses randomly chosen starting values). It is well-known that when each component of a normal mixture may have its own mean and variance, the likelihood has no maximizer; in such cases, we hope to find a "nice" local maximum with this algorithm instead, but occasionally the algorithm finds a "not nice" solution and one of the variances goes to zero, driving the likelihood to infinity.
<code>verb</code>	If <code>TRUE</code> , then various updates are printed during each iteration of the algorithm.
<code>fast</code>	If <code>TRUE</code> and <code>k==2</code> and <code>arbmean==TRUE</code> , then use <code>normalmixEM2comp</code> , which is a much faster version of the EM algorithm for this case. This version is less protected against certain kinds of underflow that can cause numerical problems and it does not permit any restarts. If <code>k>2</code> , <code>fast</code> is ignored.

ECM	logical: Should this algorithm be an ECM algorithm in the sense of Meng and Rubin (1993)? If FALSE, the algorithm is a true EM algorithm; if TRUE, then every half-iteration alternately updates the means conditional on the variances or the variances conditional on the means, with an extra E-step in between these updates.
arbmean	If TRUE, then the component densities are allowed to have different <code>mu</code> s. If FALSE, then a scale mixture will be fit. Initial value ignored unless <code>mu</code> is NULL.
arbvar	If TRUE, then the component densities are allowed to have different <code>sigma</code> s. If FALSE, then a location mixture will be fit. Initial value ignored unless <code>sigma</code> is NULL.

Details

This is the standard EM algorithm for normal mixtures that maximizes the conditional expected complete-data log-likelihood at each M-step of the algorithm. If desired, the EM algorithm may be replaced by an ECM algorithm (see `ECM` argument) that alternates between maximizing with respect to the `mu` and `lambda` while holding `sigma` fixed, and maximizing with respect to `sigma` and `lambda` while holding `mu` fixed. In the case where `arbmean` is FALSE and `arbvar` is TRUE, there is no closed-form EM algorithm, so the ECM option is forced in this case.

Value

`normalmixEM` returns a list of class `mixEM` with items:

<code>x</code>	The raw data.
<code>lambda</code>	The final mixing proportions.
<code>mu</code>	The final mean parameters.
<code>sigma</code>	The final standard deviations. If <code>arbmean = FALSE</code> , then only the smallest standard deviation is returned. See <code>scale</code> below.
<code>scale</code>	If <code>arbmean = FALSE</code> , then the scale factor for the component standard deviations is returned. Otherwise, this is omitted from the output.
<code>loglik</code>	The final log-likelihood.
<code>posterior</code>	An <code>nxk</code> matrix of posterior probabilities for observations.
<code>all.loglik</code>	A vector of each iteration's log-likelihood. This vector includes both the initial and the final values; thus, the number of iterations is one less than its length.
<code>restarts</code>	The number of times the algorithm restarted due to unacceptable choice of initial values.
<code>ft</code>	A character vector giving the name of the function.

normalmixEM2comp *Fast EM Algorithm for 2-Component Mixtures of Univariate Normals*

Description

Return EM algorithm output for mixtures of univariate normal distributions for the special case of 2 components, exploiting the simple structure of the problem to speed up the code.

Usage

```
normalmixEM2comp(x, lambda, mu, sigsqrd, eps= 1e-8, maxit = 1000, verb=FALSE)
```

Arguments

x	A vector of length n consisting of the data.
lambda	Initial value of first-component mixing proportion.
mu	A 2-vector of initial values for the mean parameters.
sigsqrd	Either a scalar or a 2-vector with initial value(s) for the variance parameters. If a scalar, the algorithm assumes that the two components have equal variances; if a 2-vector, it assumes that the two components do not have equal variances.
eps	The convergence criterion. Convergence is declared when the change in the observed data log-likelihood increases by less than epsilon.
maxit	The maximum possible number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Details

This code is written to be very fast, sometimes more than an order of magnitude faster than [normalmixEM](#) for the same problem. It is less numerically stable than [normalmixEM](#) in the sense that it does not safeguard against underflow as carefully.

Note that when the two components are assumed to have unequal variances, the loglikelihood is unbounded. However, in practice this is rarely a problem and quite often the algorithm converges to a "nice" local maximum.

Value

`normalmixEM2comp` returns a list of class `mixEM` with items:

<code>x</code>	The raw data.
<code>lambda</code>	The final mixing proportions (lambda and 1-lambda).
<code>mu</code>	The final two mean parameters.
<code>sigma</code>	The final one or two standard deviations.
<code>loglik</code>	The final log-likelihood.
<code>posterior</code>	An $n \times 2$ matrix of posterior probabilities for observations.
<code>all.loglik</code>	A vector of each iteration's log-likelihood. This vector includes both the initial and the final values; thus, the number of iterations is one less than its length.
<code>restarts</code>	The number of times the algorithm restarted due to unacceptable choice of initial values (always zero).
<code>ft</code>	A character vector giving the name of the function.

```

 npEM

Nonparametric EM-like Algorithm for Mixtures of Independent Repeated Measurements

Description

Returns nonparametric EM algorithm output (Benaglia et al, 2009a) for mixtures of multivariate (repeated measures) data where the coordinates of a row (case) in the data matrix are assumed to be independent, conditional on the mixture component (subpopulation) from which they are drawn.

Usage

```
npEM(x, mu0, blockid = 1:ncol(x),
     bw = bw.nrd0(as.vector(as.matrix(x))), samebw = TRUE,
     h = bw, eps = 1e-8,
     maxiter = 300, stochastic = FALSE, verb = TRUE)
```

Arguments

<code>x</code>	An $n \times r$ matrix of data. Each of the n rows is a case, and each case has r repeated measurements. These measurements are assumed to be conditionally independent, conditional on the mixture component (subpopulation) from which the case is drawn.
<code>mu0</code>	Either an $m \times r$ matrix specifying the initial centers for the kmeans function, or an integer m specifying the number of initial centers, which are then chosen randomly in kmeans
<code>blockid</code>	A vector of length r identifying coordinates (columns of <code>x</code>) that are assumed to be identically distributed (i.e., in the same block). For instance, the default has all distinct elements, indicating that no two coordinates are assumed identically distributed and thus a separate set of m density estimates is produced for each column of x . On the other hand, if <code>blockid=rep(1, ncol(x))</code> , then the coordinates in each row are assumed conditionally i.i.d.
<code>bw</code>	Bandwidth for density estimation, equal to the standard deviation of the kernel density. By default, a simplistic application of the default <code>bw.nrd0</code> bandwidth used by density to the entire dataset.
<code>samebw</code>	Logical: If TRUE, use the same bandwidth for each iteration and for each component and block. If FALSE, use a separate bandwidth for each component and block, and update this bandwidth at each iteration of the algorithm using a suitably modified <code>bw.nrd0</code> method as described in Benaglia et al (2009b).
<code>h</code>	Alternative way to specify the bandwidth, to provide backward compatibility.
<code>eps</code>	Tolerance limit for declaring algorithm convergence. Convergence is declared whenever the maximum change in any coordinate of the <code>lambda</code> vector (of mixing proportion estimates) does not exceed <code>eps</code> .
<code>maxiter</code>	The maximum number of iterations allowed, for both stochastic and non-stochastic versions; for non-stochastic algorithms (<code>stochastic = FALSE</code>), convergence may be declared before <code>maxiter</code> iterations (see <code>eps</code> above).
<code>stochastic</code>	Flag, if FALSE (the default), runs the non-stochastic version of the npEM algorithm, as in Benaglia et al (2009a). Set to TRUE to run a stochastic version which simulates the posteriors at each iteration, and runs for <code>maxiter</code> iterations.
<code>verb</code>	If TRUE, print updates for every iteration of the algorithm as it runs

Value

npEM returns a list of class npEM with the following items:

`data` The raw data (an $n \times r$ matrix).

posteriors	An $n \times m$ matrix of posterior probabilities for observation. If <code>stochastic = TRUE</code> , this matrix is computed from an average over the <code>maxiter</code> iterations.
bandwidth	If <code>samebw==TRUE</code> , same as the <code>bw</code> input argument; otherwise, value of <code>bw</code> matrix at final iteration. This information is needed by any method that produces density estimates from the output.
blockid	Same as the <code>blockid</code> input argument, but recoded to have positive integer values. Also needed by any method that produces density estimates from the output.
lambda	The sequence of mixing proportions over iterations.
lambdahat	The final mixing proportions if <code>stochastic = FALSE</code> , or the average mixing proportions if <code>stochastic = TRUE</code> .
loglik	The sequence of log-likelihoods over iterations.

Examples

```
## Examine and plot water-level task data set.

## First, try a 3-component solution where no two coordinates are
## assumed i.d.
data(Waterdata)
a <- npEM(Waterdata, mu0=3, bw=4) # Assume indep but not iid
plot(a) # This produces 8 plots, one for each coordinate

## Next, same thing but pairing clock angles that are directly opposite one
## another (1:00 with 7:00, 2:00 with 8:00, etc.)
b <- npEM(Waterdata, mu0=3, blockid=c(4,3,2,1,3,4,1,2), bw=4) # iid in pairs
plot(b) # Now only 4 plots, one for each block
```

plot.mixEM

*Various Plots Pertaining to Mixture Models***Description**

Takes an object of class `mixEM` and returns various graphical output for select mixture models.

Usage

```
## S3 method for class 'mixEM':
plot(x, whichplots = 1,
     loglik = 1 %in% whichplots,
     density = 2 %in% whichplots,
     xlab1="Iteration", ylab1="Log-Likelihood",
     main1="Observed Data Log-Likelihood", coll=1, lwd1=2,
     xlab2=NULL, ylab2=NULL, main2=NULL, col2=NULL,
     lwd2=2,
     alpha = 0.05, marginal = FALSE, ...)
```

Arguments

<code>x</code>	An object of class <code>mixEM</code> .
<code>whichplots</code>	vector telling which plots to produce: 1 = loglikelihood plot, 2 = density plot. Irrelevant if <code>loglik</code> and <code>density</code> are specified.
<code>loglik</code>	If TRUE, a plot of the log-likelihood versus the EM iterations is given.
<code>density</code>	Graphics pertaining to certain mixture models. The details are given below.
<code>xlab1, ylab1, main1, coll, lwd1</code>	Graphical parameters <code>xlab</code> , ..., <code>lwd</code> to be passed to the loglikelihood plot. Trying to change these parameters using <code>xlab</code> , ..., <code>lwd</code> will result in an error, but all other graphical parameters are passed directly to the plotting functions via ...
<code>xlab2, ylab2, main2, col2, lwd2</code>	Same as <code>xlab1</code> etc. but for the density plot
<code>alpha</code>	A vector of significance levels when constructing confidence ellipses and confidence bands for the mixture of multivariate normals and mixture of regressions cases, respectively. The default is 0.05.
<code>marginal</code>	For the mixture of bivariate normals, should optional marginal histograms be included?
<code>...</code>	Graphical parameters passed to <code>plot</code> command.

Value

`plot.mixEM` returns a plot of the log-likelihood versus the EM iterations by default for all objects of class `mixEM`. In addition, other plots may be produced for the following k-component mixture model functions:

normalmixEM	A histogram of the raw data is produced along with k density curves determined by normalmixEM.
repnormmixEM	A histogram of the raw data produced in a similar manner as for normalmixEM.
mvnormalmixEM	A 2-dimensional plot with each point color-coded to denote its most probable component membership. In addition, the estimated component means are plotted along with (1 - alpha)% bivariate normal density contours. These ellipses are constructed by assigning each value to their component of most probable membership and then using normal theory. Optional marginal histograms may also be produced.
regmixEM	A plot of the response versus the predictor with each point color-coded to denote its most probable component membership. In addition, the estimated component regression lines are plotted along with (1 - alpha)% Working-Hotelling confidence bands. These bands are constructed by assigning each value to their component of most probable membership and then performing least squares estimation.
logisregmixEM	A plot of the binary response versus the predictor with each point color-coded to denote its most probable component membership. In addition, the estimate component logistic regression lines are plotted.
regmixEM.mixed	Provides a 2x2 matrix of plots summarizing the posterior slope and posterior intercept terms from a mixture of random effects regression. See <code>post.beta</code> for a more detailed description.

     marginal = TRUE)
```

plot.mixMCMC	<i>Various Plots Pertaining to Mixture Model Output Using MCMC Methods</i>
--------------	--

Description

Takes an object of class `mixMCMC` and returns various graphical output for select mixture models.

Usage

```
## S3 method for class 'mixMCMC':
plot(x, trace.plots = TRUE,
      summary.plots = FALSE, burnin = 2000, ...)
```

Arguments

<code>x</code>	An object of class <code>mixMCMC</code> .
<code>trace.plots</code>	If TRUE, trace plots of the various parameters estimated by the MCMC methods is given.
<code>summary.plots</code>	Graphics pertaining to certain mixture models. The details are given below.
<code>burnin</code>	The values 1 to <code>burnin</code> are dropped when producing the plots in <code>summary.plots</code> .
<code>...</code>	Graphical parameters passed to <code>regcr</code> function.

Value

`plot.mixMCMC` returns trace plots of the various parameters estimated by the MCMC methods for all objects of class `mixMCMC`. In addition, other plots may be produced for the following k-component mixture model functions:

<code>regmixMH</code>	Credible bands for the regression lines in a mixture of linear regressions. See <code>regcr</code> for more details.

```

plot.npEM

*Plot Nonparametric or Semiparametric EM Output***Description**

Takes an object of class npEM and returns a set of plots of the density estimates for each block and each component. There is one plot per block, with all the components displayed on each block so it is possible to see the mixture structure for each block.

Usage

```
## S3 method for class 'npEM':
plot(x, blocks = NULL, hist=TRUE, addlegend = TRUE,
      scale=TRUE, title=NULL, breaks="Sturges", ylim=NULL, dens.col,
      newplot = TRUE, pos.legend = "topright", cex.legend = 1, ...)
## S3 method for class 'spEM':
plot(x, blocks = NULL, hist=TRUE, addlegend = TRUE,
      scale=TRUE, title=NULL, breaks="Sturges", ylim=NULL, dens.col,
      newplot = TRUE, pos.legend = "topright", cex.legend = 1, ...)
```

Arguments

x	An object of class npEM such as the output of the npEM function
blocks	Blocks (of repeated measures coordinates) to plot; not relevant for univariate case. Default is to plot all blocks.
hist	If TRUE, superimpose density estimate plots on a histogram of the data
addlegend	If TRUE, adds legend to the plot.
scale	If TRUE, scale each density estimate by its corresponding estimated mixing proportion, so that the total area under all densities equals 1 and the densities plotted may be added to produce an estimate of the mixture density. When FALSE, each density curve has area 1 in the plot.
title	Alternative vector of main titles for plots (recycled as many times as needed)
breaks	Passed directly to the hist function
ylim	ylim parameter to use for all plots, if desired. If not given, each plot uses its own ylim that ensures that no part of the plot will go past the top of the plotting area.
dens.col	Color values to use for the individual component density functions, repeated as necessary. Default value is 2 : (m+1) .
newplot	If TRUE, creates a new plot.
pos.legend	Single argument specifying the position of the legend. See ‘Details’ section of legend .
cex.legend	Character expansion factor for legend .
...	Any remaining arguments are passed to the hist and lines functions.

Value

plot.npEM returns a list with two elements:

`x` List of matrices. The j th column of the i th matrix is the vector of x -values for the j th density in the i th plot.

`y` y -values, given in the same form as the x -values.

par(mfrow=c(2,4))
plot(a) # This produces 8 plots, one for each coordinate

## Next, same thing but pairing clock angles that are directly opposite one
## another (1:00 with 7:00, 2:00 with 8:00, etc.)
b <- npEM(Waterdata, 3, blockid=c(4,3,2,1,3,4,1,2), bw=4)
par(mfrow=c(2,2))
plot(b) # Now only 4 plots, one for each block
```

plotseq.npEM	<i>Plotting sequences of estimates from non- or semiparametric EM-like Algorithm</i>
--------------	--

Description

Returns plots of the sequences of scalar parameter estimates along iterations from an object of class npEM.

Usage

```
## S3 method for class 'npEM':
plotseq(x, ...)
```

Arguments

`x` an object of class npEM, as output by [npEM](#) or [spEMsymloc](#)

`...` further parameters that are passed to [plot](#)

Details

`plotseq.npEM` returns a figure with one plot for each component proportion, and, in the case of `spEMsymloc`, one plot for each component mean.

poisregmixEM

EM Algorithm for Mixtures of Poisson Regressions

Description

Returns EM algorithm output for mixtures of Poisson regressions with arbitrarily many components.

Usage

```
poisregmixEM(y, x, lambda = NULL, beta = NULL, k = 2,
             addintercept = TRUE, epsilon = 1e-08,
             maxit = 10000, verb = FALSE)
```

Arguments

<code>y</code>	An n-vector of response values.
<code>x</code>	An n x p matrix of predictors. See <code>addintercept</code> below.
<code>lambda</code>	Initial value of mixing proportions. Entries should sum to 1. This determines number of components. If <code>NULL</code> , then <code>lambda</code> is random from uniform Dirichlet and number of components is determined by <code>beta</code> .

beta	Initial value of beta parameters. Should be a p \times k matrix, where p is the number of columns of x and k is number of components. If NULL, then beta is generated by binning the data into k bins and using glm on the values in each of the bins. If both lambda and beta are NULL, then number of components is determined by k.
k	Number of components. Ignored unless lambda and beta are both NULL.
addintercept	If TRUE, a column of ones is appended to the x matrix before the value of p is calculated.
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

poisregmixEM returns a list of class mixEM with items:

x	The predictor values.
y	The response values.
lambda	The final mixing proportions.
beta	The final Poisson regression coefficients.
loglik	The final log-likelihood.
posterior	An nxk matrix of posterior probabilities for observations.
all.loglik	A vector of each iteration's log-likelihood.
restarts	The number of times the algorithm restarted due to unacceptable choice of initial values.
ft	A character vector giving the name of the function.

`print.npEM`*Printing non- and semi-parametric multivariate mixture model fits*

Description

`print` method for class `npEM`.

Usage

```
## S3 method for class 'npEM':  
print(x, ...)
```

Arguments

`x` an object of class `npEM` such as a result of a call to `npEM`
`...` Additional arguments to `print`

Details

`print.npEM` prints the elements of an `npEM` object without printing the data or the posterior probabilities. (These may still be accessed as `x$data` and `x$posteriors`.)

Value

`print.npEM` returns (invisibly) the full value of `x` itself, including the data and posteriors elements.

See Also

RanEffdata	<i>Simulated Data from 2-Component Mixture of Regressions with Random Effects</i>
------------	---

Description

This data set was generated from a 2-component mixture of regressions with random effects.

Usage

```
RanEffdata
```

Format

This data set consists of a list with 100 25x3 matrices. The first column is the response variable, the second column is a column of 1's and the last column is the predictor variable.

See Also

[regmixEM.mixed](#)

regcr	<i>Add a Confidence Region or Bayesian Credible Region for Regression Lines to a Scatterplot</i>
-------	--

Description

Produce a confidence or credible region for regression lines based on a sample of bootstrap beta values or posterior beta values. The beta parameters are the intercept and slope from a simple linear regression.

Usage

```
regcr(beta, x, em.beta = NULL, em.sigma = NULL, alpha = .05,
      nonparametric = FALSE, plot = FALSE, xyaxes = TRUE, ...)
```

Arguments

beta	An nx2 matrix of regression parameters. The first column gives the intercepts and the second column gives the slopes.
x	An n-vector of the predictor variable which is necessary when nonparametric = TRUE.
em.beta	The estimates for beta required when obtaining confidence regions. This is required for performing the standardization necessary when obtaining nonparametric confidence regions.

<code>em.sigma</code>	The estimates for the regression standard deviation required when obtaining confidence regions. This is required for performing the standardization necessary when obtaining nonparametric confidence regions.
<code>alpha</code>	The proportion of the beta sample to remove. In other words, 1-alpha is the level of the credible region.
<code>nonparametric</code>	If <code>nonparametric = TRUE</code> , then the region is based on the convex hull of the remaining beta after trimming, which is accomplished using a data depth technique. If <code>nonparametric = FALSE</code> , then the region is based on the asymptotic normal approximation.
<code>plot</code>	If <code>plot = TRUE</code> , lines are added to the existing plot. The type of plot created depends on the value of <code>xyaxes</code> .
<code>xyaxes</code>	If <code>xyaxes = TRUE</code> and <code>plot = TRUE</code> , then a confidence or credible region for the regression lines is plotted on the x-y axes, presumably overlaid on a scatterplot of the data. If <code>xyaxes = FALSE</code> and <code>plot = TRUE</code> , the (convex) credible region for the regression line is plotted on the beta, or intercept-slope, axes, presumably overlaid on a scatterplot of beta.
<code>...</code>	Graphical parameters passed to <code>lines</code> or <code>plot</code> command.

Value

`regcr` returns a list containing the following items:

<code>boundary</code>	A matrix of points in beta, or intercept-slope, space arrayed along the boundary of the confidence or credible region.
<code>upper</code>	A matrix of points in x-y space arrayed along the upper confidence or credible limit for the regression line.
<code>lower</code>	A matrix of points in x-y space arrayed along the lower confidence or credible limit for the regression line.

regmixEM

EM Algorithm for Mixtures of Regressions

Description

Returns EM algorithm output for mixtures of multiple regressions with arbitrarily many components.

Usage

```

regmixEM(y, x, lambda = NULL, beta = NULL, sigma = NULL, k = 2,
         addintercept = TRUE, arbmean = TRUE, arbvar = TRUE,
         epsilon = 1e-08, maxit = 10000, verb = FALSE)

```

Arguments

y	An n-vector of response values.
x	An nxp matrix of predictors. See <code>addintercept</code> below.
lambda	Initial value of mixing proportions. Entries should sum to 1. This determines number of components. If NULL, then <code>lambda</code> is random from uniform Dirichlet and number of components is determined by <code>beta</code> .
beta	Initial value of <code>beta</code> parameters. Should be a pxk matrix, where p is the number of columns of x and k is number of components. If NULL, then <code>beta</code> has standard normal entries according to a binning method done on the data. If both <code>lambda</code> and <code>beta</code> are NULL, then number of components is determined by <code>sigma</code> .
sigma	A vector of standard deviations. If NULL, then $1/\sigma^2$ has random standard exponential entries according to a binning method done on the data. If <code>lambda</code> , <code>beta</code> , and <code>sigma</code> are NULL, then number of components is determined by <code>k</code> .
k	Number of components. Ignored unless all of <code>lambda</code> , <code>beta</code> , and <code>sigma</code> are NULL.
addintercept	If TRUE, a column of ones is appended to the x matrix before the value of p is calculated.
arbmean	If TRUE, each mixture component is assumed to have a different set of regression coefficients (i.e., the <code>betas</code>).
arbvar	If TRUE, each mixture component is assumed to have a different <code>sigma</code> .
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

regmixEM returns a list of class `mixEM` with items:

<code>x</code>	The set of predictors (which includes a column of 1's if <code>addintercept = TRUE</code>).
<code>y</code>	The response values.
<code>lambda</code>	The final mixing proportions.
<code>beta</code>	The final regression coefficients.
<code>sigma</code>	The final standard deviations. If <code>arbmean = FALSE</code> , then only the smallest standard deviation is returned. See <code>scale</code> below.
<code>scale</code>	If <code>arbmean = FALSE</code> , then the scale factor for the component standard deviations is returned. Otherwise, this is omitted from the output.
<code>loglik</code>	The final log-likelihood.
<code>posterior</code>	An <code>n</code> × <code>k</code> matrix of posterior probabilities for observations.
<code>all.loglik</code>	A vector of each iteration's log-likelihood.
<code>restarts</code>	The number of times the algorithm restarted due to unacceptable choice of initial values.
<code>ft</code>	A character vector giving the name of the function.

em.out[3:6]
```

regmixEM.chgpt *EM Algorithm for Mixtures of Regressions with a Changepoint*

Description

Returns EM algorithm output for a mixture of a regression with a changepoint and a simple linear regression.

Usage

```
regmixEM.chgpt(y, x, lambda = NULL, gamma = NULL, beta = NULL,
               sigma = NULL, k = 2, T = 3, t = NULL,
               epsilon = 1e-08, maxit = 10000, verb = FALSE)
```

Arguments

y	An n-vector of response values.
x	An n-vector of predictor values. A column of ones is automatically appended to x.
lambda	Initial value of mixing proportions. Entries should sum to 1. If NULL, then lambda is random from uniform Dirichlet.
gamma	Initial value of gamma parameters for the changepoint component. Should be a 3-dimensional vector. If NULL, then gamma has standard normal entries according to a binning method done on the data.
beta	Initial value of beta parameters for the simple linear regression component. Should be a 2-dimensional vector. If NULL, then beta has standard normal entries according to a binning method done on the data.
sigma	A vector of standard deviations. If NULL, then $1/\sigma^2$ has random standard exponential entries according to a binning method done on the data.
k	Number of components. Currently, this value must be set equal to 2.
T	The number of values to leave off for the range of all possible changepoints to be tested.
t	Initial value of the changepoint to consider.
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

regmixEM.chgpt returns a list of class mixEM with items:

lambda	The final mixing proportions.
gamma	The final regression coefficients for the changepoint component.

beta	The final regression coefficients for the simple linear regression component.
sigma	The final standard deviations.
cutpoint	The estimated value for the changepoint in the changepoint component.
loglik	The final log-likelihood.
posterior	A nx2 matrix of posterior probabilities for observations.
all.loglik	A vector of each iteration's log-likelihood.
restarts	The number of times the algorithm restarted due to unacceptable choice of initial values.
ft	A character vector giving the name of the function.

out
```

regmixEM.lambda	<i>EM Algorithm for Mixtures of Regressions with Local Lambda Estimates</i>
-----------------	---

Description

Returns output for one step of an EM algorithm output for mixtures of multiple regressions where the mixing proportions are estimated locally.

Usage

```
regmixEM.lambda(y, x, lambda = NULL, beta = NULL, sigma = NULL,
  k = 2, addintercept = TRUE, arbmean = TRUE,
  arbvar = TRUE, epsilon = 1e-8, maxit = 10000,
  verb = FALSE)
```

Arguments

y	An n-vector of response values.
x	An nxp matrix of predictors. See <code>addintercept</code> below.
lambda	An nxk matrix of initial local values of mixing proportions. Entries should sum to 1. This determines number of components. If NULL, then lambda is simply one over the number of components.
beta	Initial value of beta parameters. Should be a pxk matrix, where p is the number of columns of x and k is number of components. If NULL, then beta has uniform standard normal entries. If both lambda and beta are NULL, then number of components is determined by sigma.
sigma	k-vector of initial global values of standard deviations. If NULL, then $1/\sigma^2$ has random standard exponential entries. If lambda, beta, and sigma are NULL, then number of components is determined by k.
k	The number of components. Ignored unless all of lambda, beta, and sigma are NULL.
addintercept	If TRUE, a column of ones is appended to the x matrix before the value of p is calculated.
arbmean	If TRUE, each mixture component is assumed to have a different set of regression coefficients (i.e., the betas).
arbvar	If TRUE, each mixture component is assumed to have a different sigma.
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Details

Primarily used within `regmixEM.loc`.

Value

`regmixEM.lambda` returns a list of class `mixEM` with items:

x	The set of predictors (which includes a column of 1's if <code>addintercept = TRUE</code>).
y	The response values.
lambda	The inputted mixing proportions.
beta	The final regression coefficients.
sigma	The final standard deviations. If <code>arbmean = FALSE</code> , then only the smallest standard deviation is returned. See <code>scale</code> below.
scale	If <code>arbmean = FALSE</code> , then the scale factor for the component standard deviations is returned. Otherwise, this is omitted from the output.
loglik	The final log-likelihood.
posterior	An nxk matrix of posterior probabilities for observations.

all.loglik	A vector of each iteration's log-likelihood.
restarts	The number of times the algorithm restarted due to unacceptable choice of initial values.
ft	A character vector giving the name of the function.

```

regmixEM.loc	<i>Iterative Algorithm Using EM Algorithm for Mixtures of Regressions with Local Lambda Estimates</i>
--------------	---

Description

Iterative algorithm returning EM algorithm output for mixtures of multiple regressions where the mixing proportions are estimated locally.

Usage

```
regmixEM.loc(y, x, lambda = NULL, beta = NULL, sigma = NULL,
             k = 2, addintercept = TRUE, kern.l = c("Gaussian",
             "Beta", "Triangle", "Cosinus", "Optcosinus"),
             epsilon = 1e-08, maxit = 10000, kernl.g = 0,
             kernl.h = 1, verb = FALSE)
```

Arguments

y	An n-vector of response values.
x	An nxp matrix of predictors. See addintercept below.
lambda	An nxk matrix of initial local values of mixing proportions. Entries should sum to 1. This determines number of components. If NULL, then lambda is simply one over the number of components.
beta	Initial global values of beta parameters. Should be a pxk matrix, where p is the number of columns of x and k is number of components. If NULL, then beta has uniform standard normal entries. If both lambda and beta are NULL, then number of components is determined by sigma.

sigma	A k -vector of initial global values of standard deviations. If NULL, then $1/\sigma^2$ has random standard exponential entries. If lambda, beta, and sigma are NULL, then number of components determined by k .
k	Number of components. Ignored unless all of lambda, beta, and sigma are NULL.
addintercept	If TRUE, a column of ones is appended to the x matrix before the value of p is calculated.
kern.l	The type of kernel to use in the local estimation of lambda.
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
kernl.g	A shape parameter required for the symmetric beta kernel for local estimation of lambda. The default is $g = 0$ which yields the uniform kernel. Some common values are $g = 1$ for the Epanechnikov kernel, $g = 2$ for the biweight kernel, and $g = 3$ for the triweight kernel.
kernl.h	The bandwidth controlling the size of the window used in the local estimation of lambda around x .
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

regmixEM.loc returns a list of class mixEM with items:

x	The set of predictors (which includes a column of 1's if addintercept = TRUE).
y	The response values.
lambda.x	The final local mixing proportions.
beta	The final global regression coefficients.
sigma	The final global standard deviations.
loglik	The final log-likelihood.
posterior	An $n \times k$ matrix of posterior probabilities for observations.
all.loglik	A vector of each iteration's log-likelihood.
restarts	The number of times the algorithm restarted due to unacceptable choice of initial values.
ft	A character vector giving the name of the function.

regmixEM.mixed

EM Algorithm for Mixtures of Regressions with Random Effects

Description

Returns EM algorithm output for mixtures of multiple regressions with random effects and an option to incorporate fixed effects and/or AR(1) errors.

Usage

```
regmixEM.mixed(y, x, w = NULL, sigma = NULL, arb.sigma = TRUE,
              alpha = NULL, lambda = NULL, mu = NULL,
              rho = NULL, R = NULL, arb.R = TRUE, k = 2,
              ar.1 = FALSE, addintercept.fixed = FALSE,
              addintercept.random = TRUE, epsilon = 1e-08,
              maxit = 10000, verb = FALSE)
```

Arguments

y	A list of N response trajectories with (possibly) varying dimensions of length n_i .
x	A list of N design matrices of dimensions $(n_i) \times p$. Each trajectory in y has its own design matrix.
w	A list of N known explanatory variables having dimensions $(n_i) \times q$. If <code>mixed = FALSE</code> , then w is replaced by a list of N zeros.
sigma	A vector of standard deviations. If <code>NULL</code> , then $1/s^2$ has random standard exponential entries according to a binning method done on the data.
arb.sigma	If <code>TRUE</code> , then <code>sigma</code> is k-dimensional. Else a common standard deviation is assumed.
alpha	A q-vector of unknown regression parameters for the fixed effects. If <code>NULL</code> and <code>mixed = TRUE</code> , then <code>alpha</code> is random from a normal distribution with mean and variance according to a binning method done on the data. If <code>mixed = FALSE</code> , then <code>alpha = 0</code> .

<code>lambda</code>	Initial value of mixing proportions for the assumed mixture structure on the regression coefficients. Entries should sum to 1. This determines number of components. If NULL, then <code>lambda</code> is random from uniform Dirichlet and the number of components is determined by <code>mu</code> .
<code>mu</code>	A <code>p</code> x <code>k</code> matrix of the mean for the mixture components of the random regression coefficients. If NULL, then the columns of <code>mu</code> are random from a multivariate normal distribution with mean and variance determined by a binning method done on the data.
<code>rho</code>	An <code>N</code> x <code>k</code> matrix giving initial values for the correlation term in an AR(1) process. If NULL, then these values are simulated from a uniform distribution on the interval (-1, 1).
<code>R</code>	A list of <code>N</code> <code>p</code> x <code>p</code> covariance matrices for the mixture components of the random regression coefficients. If NULL, then each matrix is random from a standard Wishart distribution according to a binning method done on the data.
<code>arb.R</code>	If TRUE, then <code>R</code> is a list of <code>N</code> <code>p</code> x <code>p</code> covariance matrices. Else, one common covariance matrix is assumed.
<code>k</code>	Number of components. Ignored unless <code>lambda</code> is NULL.
<code>ar.1</code>	If TRUE, then an AR(1) process on the error terms is included. The default is FALSE.
<code>addintercept.fixed</code>	If TRUE, a column of ones is appended to the matrices in <code>w</code> .
<code>addintercept.random</code>	If TRUE, a column of ones is appended to the matrices in <code>x</code> before <code>p</code> is calculated.
<code>epsilon</code>	The convergence criterion.
<code>maxit</code>	The maximum number of iterations.
<code>verb</code>	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

`regmixEM` returns a list of class `mixEM` with items:

<code>x</code>	The predictor values corresponding to the random effects.
<code>y</code>	The response values.
<code>w</code>	The predictor values corresponding to the (optional) fixed effects.
<code>lambda</code>	The final mixing proportions.
<code>mu</code>	The final mean vectors.
<code>R</code>	The final covariance matrices.
<code>sigma</code>	The final component error standard deviations.
<code>alpha</code>	The final regression coefficients for the fixed effects.
<code>rho</code>	The final error correlation values if an AR(1) process is included.
<code>loglik</code>	The final log-likelihood.
<code>posterior.z</code>	An <code>N</code> x <code>k</code> matrix of posterior membership probabilities.

posterior.beta	A list of N pxk matrices giving the posterior regression coefficient values.
all.loglik	A vector of each iteration's log-likelihood.
restarts	The number of times the algorithm restarted due to unacceptable choice of initial values.
ft	A character vector giving the name of the function.

em.out[4:10]
```

regmixMH

Metropolis-Hastings Algorithm for Mixtures of Regressions

Description

Return Metropolis-Hastings (M-H) algorithm output for mixtures of multiple regressions with arbitrarily many components.

Usage

```
regmixMH(y, x, lambda = NULL, beta = NULL, s = NULL, k = 2,
         addintercept = TRUE, mu = NULL, sig = NULL,
         sampsize = 1000, omega = .01, thin = 1)
```

Arguments

y	An n-vector of response values.
x	An nxp matrix of predictors. See addintercept below.
lambda	Initial value of mixing proportions. Entries should sum to 1. This determines number of components. If NULL, then lambda is random from uniform Dirichlet and number of components is determined by beta.
beta	Initial value of beta parameters. Should be a pxk matrix, where p is the number of columns of x and k is number of components. If NULL, then beta has uniform standard normal entries. If both lambda and beta are NULL, then number of components is determined by s.
s	k-vector of standard deviations. If NULL, then $1/s^2$ has random standard exponential entries. If lambda, beta, and s are NULL, then number of components determined by k.
k	Number of components. Ignored unless all of lambda, beta, and s are NULL.
addintercept	If TRUE, a column of ones is appended to the x matrix before the value of p is calculated.
mu	The prior hyperparameter of same size as beta; the means of beta components. If NULL, these are set to zero.
sig	The prior hyperparameter of same size as beta; the standard deviations of beta components. If NULL, these are all set to five times the overall standard deviation of y.
sampsize	Size of posterior sample returned.
omega	Multiplier of step size to control M-H acceptance rate. Values closer to zero result in higher acceptance rates, generally.
thin	Lag between parameter vectors that will be kept.

Value

regmixMH returns a list of class mixMCMC with items:

x	A nxp matrix of the predictors.
y	A vector of the responses.
theta	A (sampsizethin) x q matrix of MCMC-sampled q-vectors, where q is the total number of parameters in beta, s, and lambda.
k	The number of components.

regmixmodel.sel *Model Selection in Mixtures of Regressions*

Description

Assess the number of components in a mixture of regressions model using the Akaike's information criterion (AIC), Schwartz's Bayesian information criterion (BIC), Bozdogan's consistent AIC (CAIC), and Integrated Completed Likelihood (ICL).

Usage

```
regmixmodel.sel(x, y, w = NULL, k = 2, type = c("fixed",
        "random", "mixed"), ...)
```

Arguments

x	An n x p matrix (or list) of predictors. If an intercept is required, then x must NOT include a column of 1's! Requiring an intercept may be controlled through arguments specified in
y	An n-vector (or list) of response values.
w	An optional list of fixed effects predictors for type "mixed" or "random".
k	The maximum number of components to assess.
type	The type of regression mixture to use. If "fixed", then a mixture of regressions with fixed effects will be used. If "random", then a mixture of regressions where the random effects regression coefficients are assumed to come from a mixture will be used. If "mixed", the mixture structure used is the same as "random", except a coefficient of fixed effects is also assumed.
. . .	Additional arguments passed to the EM algorithm used for calculating the type of regression mixture specified in type.

Value

`regmixmodel.sel` returns a matrix of the AIC, BIC, CAIC, and ICL values along with the winner (i.e., the highest value given by the model selection criterion) for various types of regression mixtures.

 repnormmixEM

EM Algorithm for Mixtures of Normals with Repeated Measurements

Description

Returns EM algorithm output for mixtures of normals with repeated measurements and arbitrarily many components.

Usage

```
repnormmixEM(x, lambda = NULL, mu = NULL, sigma = NULL, k = 2,
             arbmean = TRUE, arbvar = TRUE, epsilon = 1e-08,
             maxit = 10000, verb = FALSE)
```

Arguments

`x` An $m \times n$ matrix of data. The columns correspond to the subjects and the rows correspond to the repeated measurements.

`lambda` Initial value of mixing proportions. Entries should sum to 1. This determines number of components. If `NULL`, then `lambda` is random from uniform Dirichlet and number of components is determined by `mu`.

mu	A k-vector of component means. If NULL, then mu is determined by a normal distribution according to a binning method done on the data. If both lambda and mu are NULL, then number of components is determined by sigma.
sigma	A vector of standard deviations. If NULL, then $1/\sigma^2$ has random standard exponential entries according to a binning method done on the data. If lambda, mu, and sigma are NULL, then number of components is determined by k.
k	Number of components. Ignored unless all of lambda, mu, and sigma are NULL.
arbmean	If TRUE, then the component densities are allowed to have different mus. If FALSE, then a scale mixture will be fit.
arbvar	If TRUE, then the component densities are allowed to have different sigmas. If FALSE, then a location mixture will be fit.
epsilon	The convergence criterion.
maxit	The maximum number of iterations.
verb	If TRUE, then various updates are printed during each iteration of the algorithm.

Value

repnormmixEM returns a list of class mixEM with items:

x	The raw data.
lambda	The final mixing proportions.
mu	The final mean parameters.
sigma	The final standard deviations. If arbmean = FALSE, then only the smallest standard deviation is returned. See scale below.
scale	If arbmean = FALSE, then the scale factor for the component standard deviations is returned. Otherwise, this is omitted from the output.
loglik	The final log-likelihood.
posterior	An nxk matrix of posterior probabilities for observations.
all.loglik	A vector of each iteration's log-likelihood.
restarts	The number of times the algorithm restarted due to unacceptable choice of initial values.
ft	A character vector giving the name of the function.

rmvnorm

Simulate from a Multivariate Normal Distribution

Description

Simulate from a multivariate normal distribution

Usage

```
rmvnorm(n, mu=NULL, sigma=NULL)
```

Arguments

n	Number of vectors to simulate
mu	mean vector
sigma	covariance matrix, assumed symmetric and nonnegative definite

Details

This function uses an [eigen](#) decomposition assuming `sigma` is symmetric. In particular, the upper triangle of `sigma` is ignored.

Value

An $n \times d$ matrix in which each row is an independently generated realization from the desired multivariate normal distribution

See Also

[eigen](#), [dnorm](#), [dmvnorm](#)

`rmvnormmix`*Simulate from Multivariate (repeated measures) Mixtures of Normals*

Description

Simulate from a mixture of multivariate zero-correlation normal distributions

Usage

```
rmvnormmix(n, lambda=1, mu=0, sigma=1)
```

Arguments

<code>n</code>	Number of cases to simulate.
<code>lambda</code>	Vector of mixture probabilities with length equal to m , the desired number of components. This is assumed to sum to 1; if not, it is normalized.
<code>mu</code>	Matrix of means of dimensions $m \times r$, where m is the number of components (subpopulations) and r is the number of coordinates (repeated measurements) per case. Note: <code>mu</code> is automatically coerced to a matrix with m rows even if it is not given in this form, which can lead to unexpected behavior in some cases.
<code>sigma</code>	Matrix of standard deviations, same dimensions as <code>mu</code> . The coordinates within a case are independent, conditional on the mixture component. (There is marginal correlation among the coordinates, but this is due to the mixture structure only.) Note: <code>sigma</code> is automatically coerced to a matrix with m rows even if it is not given in this form, which can lead to unexpected behavior in some cases.

Details

It is possible to generate univariate standard normal random variables using the default values (but why bother?). The case of conditionally iid coordinates is covered by the situation in which all columns in `mu` and `sigma` are identical.

Value

`rmvnormmix` returns an $n \times r$ matrix in which each row is a sample from one of the components of a mixture of zero-correlation multivariate normals. The mixture structure induces nonzero correlations among the coordinates.

mydata<-rmvnormmix(n, lambda, mu, sigma)

## Now check to see if we can estimate mixture densities well:
title <- paste("Does this resemble N(", mu[1,], ",1) and N(", mu[2,],",1)?",
              sep="")
plot(npEM(mydata, 2), title=title)
```

rnormmix

Simulate from Mixtures of Normals

Description

Simulate from a mixture of univariate normal distributions.

Usage

```
rnormmix(n, lambda=1, mu=0, sigma=1)
```

Arguments

n	Number of cases to simulate.
lambda	Vector of mixture probabilities, with length equal to m , the desired number of components (subpopulations). This is assumed to sum to 1; if not, it is normalized.
mu	Vector of means.
sigma	Vector of standard deviations.

Details

This function simply calls `rmvnormmix`.

Value

`rnormmix` returns an n -vector sampled from an m -component mixture of univariate normal distributions.

Rod and Frame Task Data Set

Description

This data set involves assessing children longitudinally at 6 age points from ages 4 through 18 years for the rod and frame task. This task sits the child in a darkened room in front of a luminous square frame tilted at 28 degrees on its axis to the left or right. Centered inside the frame was a luminous rod also tilted 28 degrees to the left or right. The child's task was to adjust the rod to the vertical position and the absolute deviation from the vertical (in degrees) was the measured response.

Usage

RodFramedata

Format

This data frame consists of 140 children (the rows). Column 1 is the subject number and column 2 is the sex (0=MALE and 1=FEMALE). Columns 3 through 26 give the 8 responses at each of the ages 4, 5, and 7. Columns 27 through 56 give the 10 responses at each of the ages 11, 14, and 18. A value of 99 denotes missing data.

RTdata

Reaction Time (RT) Data Set

Description

This data set involves normally developing children 9 years of age presented with two visual stimuli on a computer monitor. The left image is the target stimuli and on the right is either an exact copy or a mirror image of the target stimuli. The child must press one key if it is a copy or another key if it is a mirror image. The data consists of the reaction times (RT) of the 197 children who provided correct responses for all 6 task trials.

Usage

RTdata

Format

This data frame consists of 197 children (the rows) and their 6 responses (the columns) to the stimulus presented. The response (RT) is recorded in milliseconds.

[RTdata2](#)

RTdata2

Reaction Time (RT) Data Set # 2

Description

This data set involves normally developing children 9 years of age presented visual stimuli on a computer monitor. There are three different experimental conditions, according to the length of the delay after which the stimulus was displayed on the screen. Each subject experienced each condition eight times, and these 24 trials were given in random order. These data give the 82 children for whom there are complete measurements among over 200 total subjects.

Usage

RTdata2

Format

This data frame consists of 82 children (the rows) and their 24 responses (the columns) to the stimulus presented. The response is recorded in milliseconds. The columns are not in the order in which the stimuli were presented to the children; rather, they are arranged into three blocks of eight columns each so that each eight-column block contains only trials from one of the three conditions.

 spEM

Semiparametric EM-like Algorithm for Mixtures of Independent Repeated Measurements

Description

Returns semiparametric EM algorithm output (Benaglia et al, 2009a) for mixtures of multivariate (repeated measures) data where the coordinates of a row (case) in the data matrix are assumed to be independent, conditional on the mixture component (subpopulation) from which they are drawn. For now, this algorithm only implements model (17) in Benaglia et al, in which each component and block has exactly the same (nonparametric) shape and they differ only by location and scale.

Usage

```
spEM(x, mu0, blockid = 1:ncol(x),
     bw = bw.nrd0(as.vector(as.matrix(x))), constbw = TRUE,
     h = bw, eps = 1e-8,
     maxiter = 300, stochastic = FALSE, verb = TRUE)
```

Arguments

x	An $n \times r$ matrix of data. Each of the n rows is a case, and each case has r repeated measurements. These measurements are assumed to be conditionally independent, conditional on the mixture component (subpopulation) from which the case is drawn.
mu0	Either an $m \times r$ matrix specifying the initial centers for the kmeans function, or an integer m specifying the number of initial centers, which are then chosen randomly in kmeans

<code>blockid</code>	A vector of length r identifying coordinates (columns of x) that are assumed to be identically distributed (i.e., in the same block). For instance, the default has all distinct elements, indicating that no two coordinates are assumed identically distributed and thus a separate set of m density estimates is produced for each column of x . On the other hand, if <code>blockid=rep(1, ncol(x))</code> , then the coordinates in each row are assumed conditionally i.i.d.
<code>bw</code>	Bandwidth for density estimation, equal to the standard deviation of the kernel density. By default, a simplistic application of the default <code>bw.nrd0</code> bandwidth used by <code>density</code> to the entire dataset.
<code>constbw</code>	Logical: If TRUE, use the same bandwidth for each iteration and for each component and block. If FALSE, use a separate bandwidth for each component and block, and update this bandwidth at each iteration of the algorithm using a suitably modified <code>bw.nrd0</code> method as described in Benaglia et al (2009b).
<code>h</code>	Alternative way to specify the bandwidth, to provide backward compatibility.
<code>eps</code>	Tolerance limit for declaring algorithm convergence. Convergence is declared whenever the maximum change in any coordinate of the <code>lambda</code> vector (of mixing proportion estimates) does not exceed <code>eps</code> .
<code>maxiter</code>	The maximum number of iterations allowed, for both stochastic and non-stochastic versions; for non-stochastic algorithms (<code>stochastic = FALSE</code>), convergence may be declared before <code>maxiter</code> iterations (see <code>eps</code> above).
<code>stochastic</code>	Flag, if FALSE (the default), runs the non-stochastic version of the npEM algorithm, as in Benaglia et al (2009). Set to TRUE to run a stochastic version which simulates the posteriors at each iteration, and runs for <code>maxiter</code> iterations.
<code>verb</code>	If TRUE, print updates for every iteration of the algorithm as it runs

Value

`spEM` returns a list of class `spEM` with the following items:

<code>data</code>	The raw data (an $n \times r$ matrix).
<code>posteriors</code>	An $n \times m$ matrix of posterior probabilities for observation. If <code>stochastic = TRUE</code> , this matrix is computed from an average over the <code>maxiter</code> iterations.
<code>bandwidth</code>	If <code>constbw==TRUE</code> , same as the <code>bw</code> input argument; otherwise, value of <code>bw</code> matrix at final iteration. This information is needed by any method that produces density estimates from the output.
<code>blockid</code>	Same as the <code>blockid</code> input argument, but recoded to have positive integer values. Also needed by any method that produces density estimates from the output.
<code>lambda</code>	The sequence of mixing proportions over iterations.
<code>lambdahat</code>	The final mixing proportions if <code>stochastic = FALSE</code> , or the average mixing proportions if <code>stochastic = TRUE</code> .
<code>mu</code>	The sequence of location parameters over iterations.
<code>muhat</code>	The final location parameters if <code>stochastic = FALSE</code> , or the average location parameters if <code>stochastic = TRUE</code> .
<code>sigma</code>	The sequence of scale parameters over iterations.

sigmahat The final scale parameters if `stochastic = FALSE`, or the average scale parameters if `stochastic = TRUE`.

loglik The sequence of log-likelihoods over iterations.

```

spEMsymloc	<i>Semiparametric EM-like Algorithm for univariate symmetric location mixture</i>
------------	---

Description

Returns semiparametric EM algorithm output (Bordes et al, 2007, and Benaglia et al, 2009) for location mixtures of univariate data and symmetric component density.

Usage

```
spEMsymloc(x, mu0, bw = bw.nrd0(x), h=bw, eps = 1e-8, maxiter = 100,
           stochastic = FALSE, verbose = FALSE)
```

Arguments

<code>x</code>	A vector of length n consisting of the data.
<code>mu0</code>	Either a vector specifying the initial centers for the <code>kmeans</code> function, and from which the number of component is obtained, or an integer m specifying the number of initial centers, which are then chosen randomly in <code>kmeans</code> .
<code>bw</code>	Bandwidth for density estimation, equal to the standard deviation of the kernel density.
<code>h</code>	Alternative way to specify the bandwidth, to provide backward compatibility.
<code>eps</code>	Tolerance limit for declaring algorithm convergence. Convergence is declared before <code>maxiter</code> iterations whenever the maximum change in any coordinate of the <code>lambda</code> (mixing proportion estimates) and <code>mu</code> (means) vector does not exceed <code>eps</code> .
<code>maxiter</code>	The maximum number of iterations allowed, for both stochastic and non-stochastic versions; for non-stochastic algorithms (<code>stochastic = FALSE</code>), convergence may be declared before <code>maxiter</code> iterations (see <code>eps</code> above).
<code>stochastic</code>	Flag, if <code>FALSE</code> (the default), runs the non-stochastic version of the algorithm, as in Benaglia et al (2009). Set to <code>TRUE</code> to run a stochastic version which simulates the posteriors at each iteration (as in Bordes et al, 2007), and runs for <code>maxiter</code> iterations.
<code>verbose</code>	If <code>TRUE</code> , print updates for every iteration of the algorithm as it runs

Value

`spEMsymloc` returns a list of class `npEM` with the following items:

<code>data</code>	The raw data (an $n \times r$ matrix).
<code>posteriors</code>	An $n \times m$ matrix of posterior probabilities for observations. If <code>stochastic = TRUE</code> , this matrix is computed from an average over the <code>maxiter</code> iterations.
<code>bandwidth</code>	Same as the <code>bw</code> input argument, returned because this information is needed by any method that produces density estimates from the output.
<code>lambda</code>	The sequence of mixing proportions over iterations.
<code>lambdahat</code>	The final estimate for mixing proportions if <code>stochastic = FALSE</code> , the average over the sequence if <code>stochastic = TRUE</code> .
<code>mu</code>	the sequence of component means over iterations.
<code>muhat</code>	the final estimate of component means if <code>stochastic = FALSE</code> , the average over the sequence if <code>stochastic = TRUE</code> .
<code>symmetric</code>	Flag indicating that the kernel density estimate is using a symmetry assumption.

summary.mixEM

Summarizing EM mixture model fits

Description

[summary](#) method for class mixEM.

Usage

```
## S3 method for class 'mixEM':
summary(object, digits=6, ...)
```

Arguments

object	an object of class mixEM such as a result of a call to normalmixEM
digits	Significant digits for printing values
...	further arguments passed to <code>print</code> method.

Details

[summary.mixEM](#) prints parameter estimates for each component of a fitted mixture model. The estimates printed vary with the type of model.

Value

The function [summary.mixEM](#) prints the final loglikelihood value at the solution as well as a matrix of values for each component that could include:

lambda	The estimated mixing weights
mu	The estimated mean parameters
sigma	The estimated standard deviations
theta	The estimated multinomial parameters
beta	The estimated regression parameters

summary(out)
```

summary.npEM	<i>Summarizing non- and semi-parametric multivariate mixture model fits</i>
--------------	---

Description

[summary](#) method for class npEM.

Usage

```
## S3 method for class 'npEM':
summary(object, ...)
## S3 method for class 'summary.npEM':
print(x, digits=3, ...)
```

Arguments

object, x	an object of class npEM such as a result of a call to npEM
digits	Significant digits for printing values
...	further arguments passed to or from other methods.

Details

[summary.npEM](#) prints means and variances of each block for each component. These quantities might not be part of the model, but they are estimated nonparametrically based on the posterior probabilities and the data.

Value

The function [summary.npEM](#) returns a list of type `summary.npEM` with the following components:

n	The number of observations
m	The number of mixture components
B	The number of blocks

blockid	The block ID (from 1 through B) for each of the coordinates of the multivariate observations. The <code>blockid</code> component is of length r , the dimension of each observation.
means	A $B \times m$ matrix giving the estimated mean of each block in each component.
variances	Same as <code>means</code> but giving the estimated variances instead.

summary(b)
```

```
tauequivnormalmixEM
```

Special EM Algorithm for three-component tau equivalence model

Description

Return EM algorithm output for a specific case of a three-component tau equivalence model

Usage

```
tauequivnormalmixEM(x, lambda = NULL, mu = NULL, sigma = NULL, k = 3,
  mean.constr = NULL, sd.constr = NULL,
  epsilon = 1e-08, maxit = 10000, maxrestarts=20,
  verb = FALSE, fast=FALSE, ECM = TRUE,
  arbmean = TRUE, arbvar = TRUE)
```

Arguments

<code>x</code>	A vector of length n consisting of the data.
<code>lambda</code>	Initial value of mixing proportions. Automatically repeated as necessary to produce a vector of length k , then normalized to sum to 1. If <code>NULL</code> , then <code>lambda</code> is random from a uniform Dirichlet distribution (i.e., its entries are uniform random and then it is normalized to sum to 1).

<code>mu</code>	Starting value of vector of component means. If non-NULL and a scalar, <code>arbmean</code> is set to <code>FALSE</code> . If non-NULL and a vector, <code>k</code> is set to <code>length(mu)</code> . If NULL, then the initial value is randomly generated from a normal distribution with center(s) determined by binning the data.
<code>sigma</code>	Starting value of vector of component standard deviations for algorithm. If non-NULL and a scalar, <code>arbvar</code> is set to <code>FALSE</code> . If non-NULL and a vector, <code>arbvar</code> is set to <code>TRUE</code> and <code>k</code> is set to <code>length(sigma)</code> . If NULL, then the initial value is the reciprocal of the square root of a vector of random exponential-distribution values whose means are determined according to a binning method done on the data.
<code>k</code>	Number of components. Initial value ignored unless <code>mu</code> and <code>sigma</code> are both NULL.
<code>mean.constr</code>	Irrelevant; this argument is ignored.
<code>sd.constr</code>	Equality constraints on the standard deviation parameters. See <code>mean.constr</code> .
<code>epsilon</code>	The convergence criterion. Convergence is declared when the change in the observed data log-likelihood increases by less than <code>epsilon</code> .
<code>maxit</code>	The maximum number of iterations.
<code>maxrestarts</code>	The maximum number of restarts allowed in case of a problem with the particular starting values chosen due to one of the variance estimates getting too small (each restart uses randomly chosen starting values). It is well-known that when each component of a normal mixture may have its own mean and variance, the likelihood has no maximizer; in such cases, we hope to find a "nice" local maximum with this algorithm instead, but occasionally the algorithm finds a "not nice" solution and one of the variances goes to zero, driving the likelihood to infinity.
<code>verb</code>	If <code>TRUE</code> , then various updates are printed during each iteration of the algorithm.
<code>fast</code>	If <code>TRUE</code> and <code>k==2</code> and <code>arbmean==TRUE</code> , then use <code>normalmixEM2comp</code> , which is a much faster version of the EM algorithm for this case. This version is less protected against certain kinds of underflow that can cause numerical problems and it does not permit any restarts. If <code>k>2</code> , <code>fast</code> is ignored.
<code>ECM</code>	logical: Should this algorithm be an ECM algorithm in the sense of Meng and Rubin (1993)? If <code>FALSE</code> , the algorithm is a true EM algorithm; if <code>TRUE</code> , then every half-iteration alternately updates the means conditional on the variances or the variances conditional on the means, with an extra E-step in between these updates. For <code>tauequivnormalmixEM</code> , it must be <code>TRUE</code> .
<code>arbmean</code>	If <code>TRUE</code> , then the component densities are allowed to have different <code>mus</code> . If <code>FALSE</code> , then a scale mixture will be fit. Initial value ignored unless <code>mu</code> is NULL.
<code>arbvar</code>	If <code>TRUE</code> , then the component densities are allowed to have different <code>sigmas</code> . If <code>FALSE</code> , then a location mixture will be fit. Initial value ignored unless <code>sigma</code> is NULL.

Details

This is the standard EM algorithm for normal mixtures that maximizes the conditional expected complete-data log-likelihood at each M-step of the algorithm. If desired, the EM algorithm may be

replaced by an ECM algorithm (see `ECM` argument) that alternates between maximizing with respect to the `mu` and `lambda` while holding `sigma` fixed, and maximizing with respect to `sigma` and `lambda` while holding `mu` fixed. In the case where `arbmean` is `FALSE` and `arbvar` is `TRUE`, there is no closed-form EM algorithm, so the ECM option is forced in this case.

Value

`normalmixEM` returns a list of class `mixEM` with items:

<code>x</code>	The raw data.
<code>lambda</code>	The final mixing proportions.
<code>mu</code>	The final mean parameters.
<code>sigma</code>	The final standard deviations. If <code>arbmean = FALSE</code> , then only the smallest standard deviation is returned. See <code>scale</code> below.
<code>scale</code>	If <code>arbmean = FALSE</code> , then the scale factor for the component standard deviations is returned. Otherwise, this is omitted from the output.
<code>loglik</code>	The final log-likelihood.
<code>posterior</code>	An <code>n</code> × <code>k</code> matrix of posterior probabilities for observations.
<code>all.loglik</code>	A vector of each iteration's log-likelihood. This vector includes both the initial and the final values; thus, the number of iterations is one less than its length.
<code>restarts</code>	The number of times the algorithm restarted due to unacceptable choice of initial values.
<code>ft</code>	A character vector giving the name of the function.

<code>test.equality</code>	<i>Performs Chi-Square Test for Scale and Location Mixtures</i>
----------------------------	---

Description

Performs a likelihood ratio test of a location (or scale) normal or regression mixture versus the more general model. This test is asymptotically chi-square with degrees of freedom equal to k such that k is the number of components.

Usage

```
test.equality(y, x = NULL, arbmean = TRUE, arbvar = FALSE,
             mu = NULL, sigma = NULL, beta = NULL,
             lambda = NULL, ...)
```

Arguments

<code>y</code>	The responses for <code>regmixEM</code> or the data for <code>normalmixEM</code> .
<code>x</code>	The predictors for <code>regmixEM</code> .
<code>arbmean</code>	If <code>FALSE</code> , then a scale mixture analysis is performed for <code>normalmixEM</code> or <code>regmixEM</code> .
<code>arbvar</code>	If <code>FALSE</code> , then a location mixture analysis can be performed for <code>normalmixEM</code> or <code>regmixEM</code> .
<code>mu</code>	An optional vector for starting values (under the null hypothesis) for <code>mu</code> in <code>normalmixEM</code> .
<code>sigma</code>	An optional vector for starting values (under the null hypothesis) for <code>sigma</code> in <code>normalmixEM</code> or <code>regmixEM</code> .
<code>beta</code>	An optional matrix for starting values (under the null hypothesis) for <code>beta</code> in <code>regmixEM</code> .
<code>lambda</code>	An optional vector for starting values (under the null hypothesis) for <code>lambda</code> in <code>normalmixEM</code> or <code>regmixEM</code> .
<code>...</code>	Additional arguments passed to the various EM algorithms for the mixture of interest.

Value

`test.equality` returns a list with the following items:

<code>chi.sq</code>	The chi-squared test statistic.
<code>df</code>	The degrees of freedom for the chi-squared test statistic.
<code>p.value</code>	The p-value corresponding to this likelihood ratio test.

```

```
test.equality.mixed
```

Performs Chi-Square Test for Mixed Effects Mixtures

Description

Performs a likelihood ratio test of either common variance terms between the response trajectories in a mixture of random (or mixed) effects regressions or for common variance-covariance matrices for the random effects mixture distribution.

Usage

```
test.equality.mixed(y, x, w=NULL, arb.R = TRUE,
                    arb.sigma = FALSE, lambda = NULL,
                    mu = NULL, sigma = NULL, R = NULL,
                    alpha = NULL, ...)
```

Arguments

y	The responses for regmixEM.mixed.
x	The predictors for the random effects in regmixEM.mixed.
w	The predictors for the (optional) fixed effects in regmixEM.mixed.
arb.R	If FALSE, then a test for different variance-covariance matrices for the random effects mixture is performed.
arb.sigma	If FALSE, then a test for different variance terms between the response trajectories is performed.
lambda	A vector of mixing proportions (under the null hypothesis) with same purpose as outlined in regmixEM.mixed.
mu	A matrix of the means (under the null hypothesis) with same purpose as outlined in regmixEM.mixed.
sigma	A vector of standard deviations (under the null hypothesis) with same purpose as outlined in regmixEM.mixed.
R	A list of covariance matrices (under the null hypothesis) with same purpose as outlined in regmixEM.mixed.
alpha	An optional vector of fixed effects regression coefficients (under the null hypothesis) with same purpose as outlined in regmixEM.mixed.
...	Additional arguments passed to regmixEM.mixed.

Value

`test.equality.mixed` returns a list with the following items:

<code>chi.sq</code>	The chi-squared test statistic.
<code>df</code>	The degrees of freedom for the chi-squared test statistic.
<code>p.value</code>	The p-value corresponding to this likelihood ratio test.

Waterdata

Water-Level Task Data Set

Description

This data set arises from the water-level task proposed by the Swiss psychologist Jean Piaget to assess children's understanding of the physical world. This involves presenting a child with a simple sketch of a rectangular vessel with a cap on a sheet of paper and tilted in specific orientations. The child is then required to draw a line representing the still liquid in the tilted vessel. This line defines two points of intersection with the sides of the vessel. A line through those points is drawn, then the acute angle between this line and the horizontal (the correct orientation) is measured, with sign according to the slope of the line. These signed angles are given, in degrees.

Usage

Waterdata

Format

This data frame consists of 405 children (the rows) and the degree of deviation about the horizontal (the columns) for 8 specified clock-hour orientations (11, 4, 2, 7, 10, 5, 1, and 8 o'clock, in order).

 wkde

Weighted Univariate (Normal) Kernel Density Estimate

Description

Evaluates a weighted kernel density estimate, using a Gaussian kernel, at a specified vector of points.

Usage

```
wkde(x, u=x, w=rep(1, length(x)), bw=bw.nrd0(as.vector(x)), sym=FALSE)
```

Arguments

x	Data
u	Points at which density is to be estimated
w	Weights (same length as x)
bw	Bandwidth
sym	Logical: Symmetrize about zero?

Value

A vector of the same length as u

    title <- paste("j =", j, "and b =", b)
    plot(u, wkde(xx, u, wts, bw), type="l", main=title)
  }
}

```

wquantile

Weighted quantiles

Description

Functions to compute weighted quantiles and the weighted interquartile range.

Usage

```

wquantile(wt=rep(1,length(x)), x, probs, already.sorted = FALSE, already.normalized = FALSE)
wIQR(wt=rep(1,length(x)), x, already.sorted = FALSE, already.normalized = FALSE)

```

Arguments

wt	Vector of weights
x	Vector of data, same length as wt
probs	Numeric vector of probabilities with values in [0,1].
already.sorted	If FALSE, sort wt and x in increasing order of x. If TRUE, it is assumed that wt and x are already sorted.

`already.normalized`

If FALSE, normalize `wt` by dividing each entry by the sum of all entries. If TRUE, it is assumed that `sum(wt) == 1`

Details

`wquantile` uses the [findInterval](#) function. `wIQR` calls the `wquantile` function.

Value

Returns the sample quantiles or interquartile range of a discrete distribution with support points `x` and corresponding probability masses `wt`

[npEM](#)

Examples

```
IQR(1:10)
wIQR(x=1:10) # Note: Different algorithm than IQR function
wIQR(1:10,1:10) # Weighted quartiles are now 4 and 8
```
